

## TPS717-Q1

### Low-Noise, High-Bandwidth PSRR, Low-Dropout, 150-mA Linear Regulator

#### 1 Features

- AEC-Q100 Qualified with the Following Results:
  - Device Temperature Grade 1:  $-40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$  Ambient Operating Temperature Range
  - Device HBM ESD Classification Level 2
  - Device HBM ESD Classification Level C4B
- Input Voltage: 2.5 V to 6.5 V
- Available in Multiple Output Versions:
  - Fixed Output with Voltages from 0.9 V to 5 V
  - Adjustable Output Voltage from 0.9 V to 6.2 V
- Ultra-High PSRR:
  - 70 dB at 1 kHz, 67 dB at 100 kHz, and 45 dB at 1 MHz
- Excellent Load and Line Transient Response
- Very Low Dropout: 170 mV typical at 150 mA
- Low Noise:  $30\ \mu\text{V}_{\text{RMS}}$  typical (100 Hz to 100 kHz)
- Small 5-pin SOT, 2-mm  $\times$  2-mm WSON-6, and 1.5-mm  $\times$  1.5-mm WSON-6 Packages

#### 2 Applications

- PLLs
- VCOs
- Camera Sensor Power
- Microcontroller Power
- Wireless LAN, Bluetooth<sup>®</sup>
- ADAS and Infotainment Systems

#### 3 Description

The TPS717-Q1 family of low-dropout (LDO), low-power linear regulators offers very high power-supply rejection (PSRR) and maintains very low 45- $\mu\text{A}$  ground current in an ultra-small, five-pin SOT package. The family uses an advanced BiCMOS process and a PMOSFET pass device to achieve fast start-up, very low noise, excellent transient response, and excellent PSRR performance. The TPS717-Q1 is stable with a 1- $\mu\text{F}$  ceramic output capacitor and uses a precision voltage reference and feedback loop to achieve a worst-case accuracy of 3% over all load, line, process, and temperature variations. The device family is fully specified from  $T_{\text{J}}$ ,  $T_{\text{A}} = -40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$  and is offered in a small SOT (SC70-5) package, a 2-mm  $\times$  2-mm WSON-6 package with a thermal pad, and a 1.5-mm  $\times$  1.5-mm WSON-6 package, which are ideal for small form-factor portable equipment (such as wireless handsets and PDAs). The TPS717-Q1 family of LDOs is qualified for AEC-Q100 grade 1.

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TPS717-Q1	SOT (5)	2.00 mm $\times$ 1.25 mm
	WSON (6)	2.00 mm $\times$ 2.00 mm
	WSON (6)	1.50 mm $\times$ 1.50 mm

(1) For all available packages, see the orderable addendum at the end of the datasheet.

#### Typical Application Circuit for Fixed-Voltage Versions

#### PSRR vs Frequency

Power-Supply Rejection Ratio ( $V_{\text{IN}} - V_{\text{OUT}} = 1\ \text{V}$ )

## 4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

<b>Changes from Revision B (December 2014) to Revision C</b>	<b>Page</b>
• Moved AEC-Q100 qualification bullet to first in Features list .....	1
• Added TI Design .....	1
• Changed TPS717xx-Q1 to TPS717-Q1 throughout document .....	1
• Added footnote and $C_{IN}$ , $R_2$ , and $C_{NR}$ parameters to <i>Recommended Operating Conditions</i> table .....	6
• Changed $V_{FB}$ parameter in <i>Electrical Characteristics</i> table .....	7
• Changed $\Delta V_{OUT(\Delta I_{OUT})}$ parameter typical specification in <i>Electrical Characteristics</i> table .....	7
• Changed units of $V_n$ parameter in <i>Electrical Characteristics</i> table .....	7
• Deleted UVLO parameter minimum specification from <i>Electrical Characteristics</i> table .....	7
• Changed $T_A$ to $T_J$ in x-axis of <a href="#">Figure 7</a> , <a href="#">Figure 10</a> , and <a href="#">Figure 11</a> .....	9
• Changed 40 mV/div to 40 mA/div in y-axis of <a href="#">Figure 28</a> .....	12
• Added last two sentences to <i>Undervoltage Lockout (UVLO)</i> section .....	15
• Changed last bulleted condition in <i>Normal Operation</i> section .....	15
• Changed $T_J$ specification in <i>Normal mode</i> row of <a href="#">Table 1</a> .....	16
• Added last sentence to <i>Input and Output Capacitor Requirements</i> section.....	17
• Clarified discussion of $R_2$ in second paragraph of <i>Design Considerations</i> section .....	19
• Changed first and third paragraphs of <i>Do's and Don'ts</i> section .....	20

<b>Changes from Revision A (August 2013) to Revision B</b>	<b>Page</b>
• Changed format to meet latest data sheet standards .....	1
• Changed Features list on front page: added, deleted, and reordered several bullets .....	1
• Added <i>ESD Ratings</i> table and <i>Feature Description, Device Functional Modes, Application and Implementation, Power Supply Recommendations, Layout, Device and Documentation Support, and Mechanical, Packaging, and Orderable Information</i> sections.....	1
• Added several Applications list bullets on front page .....	1
• Deleted pinout drawings from front page .....	1
• Changed pin descriptions throughout <i>Pin Functions</i> table.....	4
• Added parametric measurement for $I_{SHDN}$ for DRV package .....	7
• Changed <a href="#">Figure 1</a> , <a href="#">Figure 2</a> , <a href="#">Figure 3</a> , and <a href="#">Figure 4</a> : removed legend, added call-outs for clarity .....	8
• Changed title of <a href="#">Figure 15</a> and <a href="#">Figure 17</a> .....	9
• Changed <i>Overview</i> section .....	13
• Corrected input and output symbols in operational amplifiers in <a href="#">Functional Block Diagrams</a> .....	13
• Changed <i>Undervoltage Lockout (UVLO)</i> section text: reworded for clarity.....	15
• Deleted <i>Reverse Current Protection</i> section .....	17
• Changed <a href="#">Equation 4</a> .....	19

<b>Changes from Original (September 2012) to Revision A</b>	<b>Page</b>
• Changed front page to two-column format.....	1
• Added part number TPS71745-Q1.....	1
• Changed C3B to C4B in Features list .....	1
• Removed Ordering Information table .....	4
• Added Junction Temperature to <i>Absolute Maximum Ratings</i> table .....	5
• Changed C3B to C4B in Absolute Maximum Ratings table.....	5
• Changed Application Information section to one-column format.....	18

## 5 Pin Configuration and Functions

**DSE Package**  
1.5-mm × 1.5-mm, 6-Pin WSON  
Top View

(1) N/C = No connection

### Pin Functions

NAME	PIN NO.			I/O	DESCRIPTION
	DCK (SOT)	DRV (WSON)	DSE (WSON)		
EN	3	4	4	I	Driving the enable pin (EN) above $V_{EN(high)}$ turns on the regulator. Driving this pin below $V_{EN(low)}$ puts the regulator into standby mode, thereby disabling the output and reducing operating current.
FB	4	2	3	I	Adjustable voltage version only. The voltage at this pin is fed to the error amplifier. A resistor divider from OUT to FB sets the output voltage when in regulation.
GND	2	3	2	—	Ground
IN	1	6	6	I	Input to the device. A 0.1- $\mu$ F to 1- $\mu$ F capacitor is recommended for better performance.
N/C	—	5	5	—	Not connected. This pin can be tied to ground to improve thermal dissipation.
NR	4	2	3	—	Fixed voltage versions only. An external capacitor connected to this pin bypasses noise generated by the internal band gap, thus lowering output noise.
OUT	5	1	1	O	This pin is the regulated output voltage. A minimum capacitance of 1 $\mu$ F is required for stability from this pin to ground.

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating temperature range (unless otherwise noted), all voltages are with respect to GND<sup>(1)</sup>

		MIN	MAX	UNIT
Voltage	V <sub>IN</sub>	-0.3	7	V
	V <sub>FB</sub>	-0.3	3.6	
	V <sub>NR</sub>	-0.3	3.6	
	V <sub>EN</sub>	-0.3	V <sub>IN</sub> + 0.3 V <sup>(2)</sup>	
	V <sub>OUT</sub>	-0.3	7	
Current	I <sub>OUT</sub>	Internally limited		A
Continuous total power dissipation	P <sub>DISS</sub>	See <a href="#">Thermal Information</a> table		
Ambient temperature	T <sub>A</sub>	-40	125	°C
Operating junction temperature	T <sub>J</sub>	-55	150	°C
Storage temperature	T <sub>stg</sub>	-55	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) V<sub>EN</sub> absolute maximum rating is V<sub>IN</sub> + 0.3 V or 7 V, whichever is greater.

### 6.2 ESD Ratings

			VALUE	UNIT	
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per AEC Q100-002 <sup>(1)</sup>	±2000	V	
TPS717-Q1 in DCK and DSE packages					
V <sub>(ESD)</sub>	Electrostatic discharge	Charged device model (CDM), per AEC Q100-011	All pins	±750	V
			Corner pins, DCK (1, 3, 4, and 5)	±750	
			Corner pins, DSE (1, 3, 4, and 6)	±750	
TPS717-Q1 in DRV package					
V <sub>(ESD)</sub>	Electrostatic discharge	Charged device model (CDM), per AEC Q100-011	All pins	±500	V
			Corner pins (1, 3, 4, and 6)	±750	

- (1) AEC Q100-002 indicates HBM stressing is done in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V <sub>IN</sub>	Input voltage	2.5		6.5	V
V <sub>OUT</sub>	Output voltage	0.9		5	V
I <sub>OUT</sub>	Output current	0		150	mA
V <sub>EN</sub>	Enable voltage	0		V <sub>IN</sub>	V
C <sub>IN</sub>	Input capacitor		1		μF
R <sub>2</sub>	Lower feedback resistor	160	320	332	kΩ
C <sub>NR</sub>	Noise reduction capacitor		10		nF
C <sub>OUT</sub>	Output capacitor	1 <sup>(1)</sup>		100	μF
T <sub>J</sub>	Junction temperature	–40		125	°C

(1) Adjustable voltage version only. When using feedback resistors that are smaller than recommended, the minimum output capacitance must be greater than 5 μF.

### 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>	TPS717-Q1			UNIT	
	DCK (SOT)	DRV (WSON)	DSE (WSON)		
	5 PINS	6 PINS	6 PINS		
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	279.2	71.1	190.5	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	57.5	96.5	94.9	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	74.1	40.5	149.3	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	0.8	2.7	6.4	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter	73.1	40.9	152.8	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	n/a	10.7	n/a	°C/W

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).

## 6.5 Electrical Characteristics

Over operating temperature range ( $T_J, T_A = -40^\circ\text{C}$  to  $125^\circ\text{C}$ ),  $V_{IN} = V_{OUT(nom)} + 0.5\text{ V}$  or  $2.5\text{ V}$ , whichever is greater;  $I_{OUT} = 0.5\text{ mA}$ ,  $V_{EN} = V_{IN}$ ,  $C_{OUT} = 1\text{ }\mu\text{F}$ ,  $C_{NR} = 0.01\text{ }\mu\text{F}$ , unless otherwise noted. For the adjustable version (TPS71701-Q1),  $V_{OUT} = 2.8\text{ V}$ . Typical values are at  $T_A = 25^\circ\text{C}$ .

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
$V_{IN}$	Input voltage range <sup>(1)</sup>			2.5		6.5	V
$V_{FB}$	Feedback pin voltage (TPS71701)	$I_{OUT} = 5\text{ mA}$		-2%	0.793	2%	V
$V_{OUT}$	Output voltage range	TPS717-Q1		0.9		5	V
		TPS71701-Q1		0.9		$6.5 - V_{DO}$	
$V_{OUT}$	Output accuracy (nominal)		$T_A = 25^\circ\text{C}$			$\pm 2.5$	mV
	Output accuracy ( $V_{OUT} < 1\text{ V}$ )	Over $V_{IN}, I_{OUT}$ , temperature <sup>(2)</sup>	$V_{OUT} + 0.5\text{ V} \leq V_{IN} \leq 6.5\text{ V}$ , $0\text{ mA} \leq I_{OUT} \leq 150\text{ mA}$	-30		30	
	Output accuracy ( $V_{OUT} \geq 1\text{ V}$ )	Over $V_{IN}, I_{OUT}$ , temperature <sup>(2)</sup>	$V_{OUT} + 0.5\text{ V} \leq V_{IN} \leq 6.5\text{ V}$ , $0\text{ mA} \leq I_{OUT} \leq 150\text{ mA}$	-3%		3%	
$\Delta V_{OUT(\Delta V_{IN})}$	Line regulation <sup>(1)</sup>	$V_{OUT(nom)} + 0.5\text{ V} \leq V_{IN} \leq 6.5\text{ V}$ , $I_{OUT} = 5\text{ mA}$			125		$\mu\text{V/V}$
$\Delta V_{OUT(\Delta I_{OUT})}$	Load regulation	$0\text{ mA} \leq I_{OUT} \leq 150\text{ mA}$			70		$\mu\text{V/mA}$
$V_{DO}$	Dropout voltage <sup>(3)</sup> ( $V_{IN} = V_{OUT(nom)} - 0.1\text{ V}$ )	$I_{OUT} = 150\text{ mA}$			170	300	mV
$I_{LIM}(\text{fixed})$	Output current limit (fixed output)	$V_{OUT} = 0.9 \times V_{OUT(nom)}$		200	325	575	mA
$I_{LIM}(\text{adjustable})$	Output current limit (TPS71701-Q1)	$V_{OUT} = 0.9 \times V_{OUT(nom)}$		200	325	575	mA
$I_{GND}$	Ground pin current	$I_{OUT} = 0.1\text{ mA}$			45	80	$\mu\text{A}$
		$I_{OUT} = 150\text{ mA}$			100		
$I_{SHDN}$	Shutdown current ( $I_{GND}$ )	$V_{EN} \leq 0.4\text{ V}$ , $2.5\text{ V} \leq V_{IN} < 4.5\text{ V}$ , $T_A = -40^\circ\text{C}$ to $125^\circ\text{C}$			0.20	1.5	$\mu\text{A}$
		$V_{EN} \leq 0.4\text{ V}$ , $4.5\text{ V} \leq V_{IN} \leq 6.5\text{ V}$ , $T_A = -40^\circ\text{C}$ to $125^\circ\text{C}$			0.90		
		$V_{EN} \leq 0.4\text{ V}$ , $2.5\text{ V} \leq V_{IN} < 4.5\text{ V}$ , $T_A = -40^\circ\text{C}$ to $125^\circ\text{C}$ , DRV package				2	
$I_{FB}$	Feedback pin current (TPS71701-Q1)				0.02	1	$\mu\text{A}$
PSRR	Power-supply rejection ratio	$V_{IN} = 3.8\text{ V}$ , $V_{OUT} = 2.8\text{ V}$ , $I_{OUT} = 150\text{ mA}$	$f = 100\text{ Hz}$		70		dB
			$f = 1\text{ kHz}$		70		
			$f = 10\text{ kHz}$		67		
			$f = 100\text{ kHz}$		67		
			$f = 1\text{ MHz}$		45		
$V_n$	Output noise voltage	$BW = 100\text{ Hz}$ to $100\text{ kHz}$ , $V_{IN} = 3.8\text{ V}$ , $V_{OUT} = 2.8\text{ V}$ , $I_{OUT} = 10\text{ mA}$	$C_{NR} = \text{none}$		$95 \times V_{OUT}$		$\mu\text{V}_{RMS}/\text{V}$
			$C_{NR} = 0.001\text{ }\mu\text{F}$		$25 \times V_{OUT}$		
			$C_{NR} = 0.01\text{ }\mu\text{F}$		$12.5 \times V_{OUT}$		
			$C_{NR} = 0.1\text{ }\mu\text{F}$		$11.5 \times V_{OUT}$		
$t_{STR}$	Startup time	$V_{OUT} = 90\%$ $V_{OUT(nom)}$ , $R_L = 19\text{ }\Omega$ , $C_{OUT} = 1\text{ }\mu\text{F}$	$0.9\text{ V} \leq V_{OUT} \leq 1.6\text{ V}$ , $C_{NR} = 0.001\text{ }\mu\text{F}$		0.700		ms
			$1.6\text{ V} < V_{OUT} < V_{OUT(max)}$ , $C_{NR} = 0.01\text{ }\mu\text{F}$			0.160	
$V_{EN(high)}$	Enable high (enabled)	$V_{IN} \leq 5.5\text{ V}$		1.2		$6.5^{(4)}$	V
		$5.5\text{ V} < V_{IN} \leq 6.5\text{ V}$		1.25		6.5	
$V_{EN(low)}$	Enable low (shutdown)			0		0.4	V
$I_{EN(high)}$	Enable pin current, enabled	$EN = 6.5\text{ V}$			0.02	1	$\mu\text{A}$
$T_{sd}$	Thermal shutdown temperature	Shutdown, temperature increasing			160		$^\circ\text{C}$
		Reset, temperature decreasing			140		
UVLO	Undervoltage lockout	$V_{IN}$ rising			2.45	2.49	V
	Hysteresis	$V_{IN}$ falling			150		mV

(1) Minimum  $V_{IN} = V_{OUT} + V_{DO}$  or  $2.5\text{ V}$ , whichever is greater.

(2) Does not include external resistor tolerances.

(3)  $V_{DO}$  is not measured for devices with  $V_{OUT(nom)} < 2.6\text{ V}$  because minimum  $V_{IN} = 2.5\text{ V}$ .

(4) Maximum  $V_{EN(high)} = V_{IN} + 0.3$  or  $6.5\text{ V}$ , whichever is smaller.

### 6.6 Typical Characteristics

Over operating temperature range ( $T_J, T_A = -40^\circ\text{C}$  to  $125^\circ\text{C}$ ),  $V_{IN} = V_{OUT(nom)} + 0.5\text{ V}$  or  $2.5\text{ V}$ , whichever is greater;  $I_{OUT} = 0.5\text{ mA}$ ,  $V_{EN} = V_{IN}$ ,  $C_{OUT} = 1\text{ }\mu\text{F}$ ,  $C_{NR} = 0.01\text{ }\mu\text{F}$ , unless otherwise noted. For the adjustable version (TPS71701-Q1),  $V_{OUT} = 2.8\text{ V}$ . Typical values are at  $T_A = 25^\circ\text{C}$ .

## 7 Detailed Description

### 7.1 Overview

The TPS717-Q1 family of low-dropout (LDO) regulators combines the high performance required by many RF and precision analog applications with ultra-low current consumption. High PSRR is provided by a high-gain, high-bandwidth error loop with good supply rejection with very low headroom ( $V_{IN} - V_{OUT}$ ). Fixed voltage versions provide a noise reduction pin to bypass noise generated by the band-gap reference and to improve PSRR. A quick-start circuit fast-charges this capacitor at startup. The combination of high performance and low ground current also make the TPS717-Q1 family of devices an excellent choice for battery-powered applications. All versions have thermal and overcurrent protection. These devices are all also AEC-100 qualified for the grade 1 temperature range.

### 7.2 Functional Block Diagrams

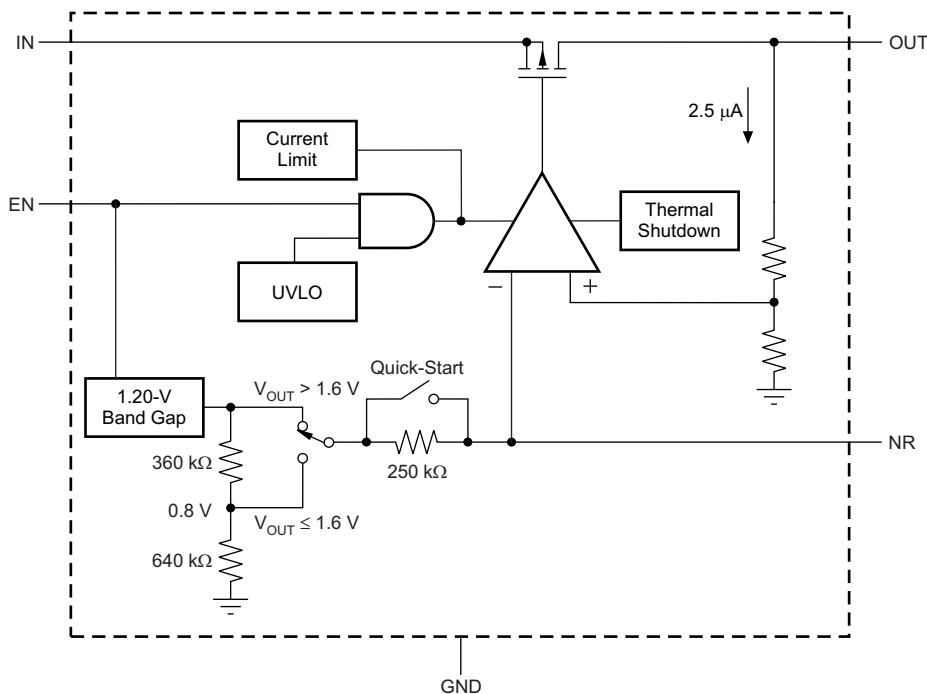

Figure 31. Fixed Voltage Versions

**Functional Block Diagrams (continued)**

**Figure 32. Adjustable Voltage Version**

## 7.3 Feature Description

### 7.3.1 Internal Current Limit

The TPS717-Q1 internal current limit helps protect the regulator during fault conditions. During current limit, the output sources a fixed amount of current that is largely independent of output voltage. For reliable operation, do not operate the device in a current-limit state for extended periods of time.

The PMOS pass element in the TPS717-Q1 has a built-in body diode that conducts current when the voltage at OUT exceeds the voltage at IN. This current is not limited, so if extended reverse voltage operation is anticipated, external limiting may be appropriate.

### 7.3.2 Shutdown

The enable pin (EN) is active high and compatible with standard and low voltage, TTL-CMOS levels. When shutdown capability is not required, EN can be connected to IN.

### 7.3.3 Startup and Noise Reduction Capacitor

Fixed voltage versions of the TPS717-Q1 use a quick-start circuit to fast-charge the noise reduction capacitor,  $C_{NR}$ , if present (see [Figure 31](#)). This circuit allows the combination of very low output noise and fast start-up times. The NR pin is high impedance, so a low-leakage  $C_{NR}$  capacitor must be used; most ceramic capacitors are appropriate in this configuration.

Note that for fastest startup, apply  $V_{IN}$  first, then the enable pin (EN) driven high. If EN is tied to IN, startup is somewhat slower; see [Figure 29](#) in the *Typical Characteristics* section. The quick-start switch is closed for approximately 135  $\mu$ s. To ensure that  $C_{NR}$  is fully charged during the quick-start time, use a 0.01- $\mu$ F or smaller capacitor.

## Feature Description (continued)

For output voltages below 1.6 V, a voltage divider on the band-gap reference voltage is employed to optimize output regulation performance for lower output voltages. This configuration results in an additional resistor in the quick-start path and combined with the noise reduction capacitor ( $C_{NR}$ ) results in slower start-up times for output voltages below 1.6 V.

**Equation 1** approximates the start-up time as a function of  $C_{NR}$  for output voltages below 1.6 V:

$$t_{START} = 160\mu\text{s} + (540 \frac{\mu\text{s}}{\text{nF}} \times C_{NR}\text{nF})\mu\text{s} \quad (1)$$

### 7.3.4 Undervoltage Lockout (UVLO)

The TPS717-Q1 uses an undervoltage lockout circuit to keep the output shut off until the internal circuitry is operating properly. The UVLO circuit has a limited glitch immunity so undershoot transients are typically ignored on the input if these transients are less than 5  $\mu\text{s}$  in duration. Note that a slow  $V_{IN}$  ramp can cause the output voltage to rise when  $V_{IN}$  is between 1.1 V to 1.4 V when at hot temperatures. When the input is lower than 1.4 V, the UVLO circuit may not have enough headroom to keep the output fully off.

### 7.3.5 Minimum Load

The TPS717-Q1 is stable with no output load. Traditional PMOS LDO regulators suffer from lower loop gain at very light output loads. The TPS717-Q1 employs an innovative low-current mode circuit to increase loop gain under very light or no-load conditions, resulting in improved output voltage regulation performance down to zero output current.

### 7.3.6 Thermal Protection

Thermal protection disables the output when the junction temperature rises to approximately 160°C, allowing the device to cool. When the junction temperature cools to approximately 140°C the output circuitry is again enabled. Depending on power dissipation, thermal resistance, and ambient temperature, the thermal protection circuit can cycle on and off. This cycling limits the dissipation of the regulator, protecting it from damage because of overheating.

Any tendency to activate the thermal protection circuit indicates excessive power dissipation or an inadequate heatsink. For reliable operation, limit junction temperature to 125°C maximum. To estimate the margin of safety in a complete design (including heatsink), increase the ambient temperature until the thermal protection is triggered; use worst-case loads and signal conditions. For good reliability, trigger thermal protection at least 35°C above the maximum expected ambient condition of a particular application. This configuration produces a worst-case junction temperature of 125°C at the highest expected ambient temperature and worst-case load.

The internal protection circuitry of the TPS717-Q1 is designed to protect against overload conditions. This circuitry is not intended to replace proper heatsinking. Continuously running the TPS717-Q1 into thermal shutdown degrades device reliability.

## 7.4 Device Functional Modes

### 7.4.1 Normal Operation

The device regulates to the nominal output voltage under the following conditions:

- The input voltage has previously exceeded the UVLO rising voltage and has not decreased below the UVLO falling threshold.
- The input voltage is greater than the nominal output voltage added to the dropout voltage.
- The enable voltage has previously exceeded the enable rising threshold voltage and has not decreased below the enable falling threshold.
- The output current is less than the current limit.
- The device junction temperature is within the specified junction temperature range.

## Device Functional Modes (continued)

### 7.4.2 Dropout Operation

If the input voltage is lower than the nominal output voltage plus the specified dropout voltage, but all other conditions are met for normal operation, the device operates in dropout mode. In this condition, the output voltage is the same as the input voltage minus the dropout voltage. The transient performance of the device is significantly degraded because the pass device is in a triode state and no longer controls the current through the LDO. Line or load transients in dropout can result in large output voltage deviations.

### 7.4.3 Disabled

The device is disabled under the following conditions:

- The input voltage is less than the UVLO falling voltage, or has not yet exceeded the UVLO rising threshold.
- The enable voltage is less than the enable falling threshold voltage or has not yet exceeded the enable rising threshold.
- The device junction temperature is greater than the thermal shutdown temperature.

[Table 1](#) shows the conditions that lead to the different modes of operation.

**Table 1. Device Functional Mode Comparison**

OPERATING MODE	PARAMETER			
	$V_{IN}$	$V_{EN}$	$I_{OUT}$	$T_J$
Normal mode	$V_{IN} > V_{OUT(nom)} + V_{DO}$ and $V_{IN} > UVLO$	$V_{EN} > V_{EN(high)}$	$I_{OUT} < I_{CL}$	$T_J < 125^{\circ}C$
Dropout mode	$UVLO < V_{IN} < V_{OUT(nom)} + V_{DO}$	$V_{EN} > V_{EN(high)}$	—	$T_J < 165^{\circ}C$
Disabled mode (any true condition disables the device)	$V_{IN} < UVLO - V_{hys}$	$V_{EN} < V_{EN(low)}$	—	$T_J > 165^{\circ}C$

## 8 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The TPS717-Q1 belongs to a family of new generation LDO regulators that use innovative circuitry to achieve ultra-wide bandwidth and high loop gain, resulting in extremely high PSRR at very low headroom ( $V_{IN} - V_{OUT}$ ). Fixed voltage versions provide a noise reduction pin to bypass noise generated by the band-gap reference and to improve PSRR when a quick-start circuit fast-charges this capacitor. These features, combined with low noise, enable, low ground pin current, and ultra-small packaging, make this part ideal for automotive applications. This family of regulators offers sub-band-gap output voltages, current limit, and thermal protection, and is fully specified from  $-40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ .

#### 8.1.1 Transient Response

As with any regulator, increasing the size of the output capacitor reduces overshoot or undershoot magnitude but increases duration of the transient. The TPS717-Q1 has an ultra-wide loop bandwidth that allows it to respond quickly to load transient events. As with any regulator, the loop bandwidth is finite and the initial transient voltage peak is controlled by the sizing of the output capacitor. Typically, larger output capacitors reduce the peak and also reduce the bandwidth of the LDO, thus slowing the response time.

#### 8.1.2 Input and Output Capacitor Requirements

Although an input capacitor is not required for stability, good analog design practice is to connect a  $0.1\text{-}\mu\text{F}$  or larger low equivalent series resistance (ESR) capacitor from IN to GND near the regulator. This capacitor counteracts reactive input sources and improves transient response, noise rejection, and ripple rejection. A higher-value capacitor may be necessary if large, fast rise-time load transients are anticipated or if the device is located several inches from the power source. If source impedance is not sufficiently low, a  $0.1\text{-}\mu\text{F}$  input capacitor may be necessary to ensure stability.

The TPS717-Q1 is designed to be stable with ceramic output capacitors of values  $1\text{ }\mu\text{F}$  or larger. The X5R- and X7R-type capacitors are best because they have minimal variation in value and ESR over temperature. The maximum ESR of the output capacitor must be less than  $1\text{ }\Omega$ . The minimum output capacitance is increased to  $5\text{ }\mu\text{F}$  or larger if using an  $R_2$  value outside of the range of  $160\text{ k}\Omega$  to  $320\text{ k}\Omega$ .

#### 8.1.3 Dropout Voltage

The TPS717-Q1 uses a PMOS pass transistor to achieve low dropout. When  $(V_{IN} - V_{OUT})$  is less than the dropout voltage ( $V_{DO}$ ), the PMOS pass device is in its linear region of operation and the input-to-output resistance is the  $R_{DSon}$  of the PMOS pass element.  $V_{DO}$  scales approximately with output current because the PMOS device functions as a resistor in dropout.

As with any linear regulator, PSRR and transient response are degraded when  $(V_{IN} - V_{OUT})$  approaches dropout. This effect is illustrated in [Figure 15](#) through [Figure 17](#) in the *Typical Characteristics* section.

## Application Information (continued)

### 8.1.4 Power Dissipation

The ability to remove heat from the die is different for each package type, presenting different considerations in the printed circuit board (PCB) layout. The PCB area around the device that is free of other components moves the heat from the device to the ambient air. Performance data for JEDEC low- and high-K boards are given in the [Thermal Information](#) table. Using heavier copper increases the effectiveness in removing heat from the device. The addition of plated through-holes to heat-dissipating layers also improves the heatsink effectiveness.

Power dissipation depends on input voltage and load conditions. Power dissipation ( $P_D$ ) is equal to the product of the output current times the voltage drop across the output pass element ( $V_{IN}$  to  $V_{OUT}$ ), as shown in [Equation 2](#):

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT} \quad (2)$$

### 8.1.5 Output Noise

In most LDOs, the band gap is the dominant noise source. If a noise reduction capacitor ( $C_{NR}$ ) is used with the TPS717-Q1, the band gap does not contribute significantly to noise. Instead, noise is dominated by the output resistor divider and the error amplifier input. To minimize noise in a given application, use a 0.01- $\mu$ F (minimum) noise reduction capacitor; for the adjustable version, smaller value resistors in the output resistor divider reduce noise. A parallel combination that gives 2.5  $\mu$ A of divider current has the same noise performance as a fixed voltage version.

[Equation 3](#) approximates the total noise referred to the feedback point (FB pin) when  $C_{NR} = 0.01 \mu$ F:

$$V_N = 11.5 \frac{\mu V_{RMS}}{V} \times V_{OUT} \quad (3)$$

## 8.2 Typical Application

[Figure 33](#) shows the basic circuit connections for the fixed voltage options. [Figure 34](#) gives the connections for the adjustable output version (TPS71701-Q1). **Note that the NR pin is not available on the adjustable version.**

**Figure 33. Typical Application Circuit (Fixed Voltage Versions)**

**Figure 34. Typical Application Circuit (Adjustable Voltage Version)**

## 8.2.1 Design Requirements

Table 2 summarizes the design requirements for Figure 35.

**Table 2. Design Requirements**

PARAMETER	DESIGN REQUIREMENT
Input voltage	3.3 V, ±10%
Output voltage	2.8 V, ±5%
Output current	100 mA typical, 150 mA peak
Output voltage transient deviation	5%
Maximum ambient temperature	85°C

## 8.2.2 Detailed Design Procedure

### 8.2.2.1 Design Considerations

For the adjustable version (TPS71701-Q1), the NR pin is replaced with a feedback (FB) pin. The voltage on this pin sets the output voltage and is determined by the values of R<sub>1</sub> and R<sub>2</sub>. The values of R<sub>1</sub> and R<sub>2</sub> can be calculated for any voltage using the formula given in Equation 4:

$$V_{OUT} = V_{REF} \times \left( 1 + \frac{R_1}{R_2} \right) \quad (4)$$

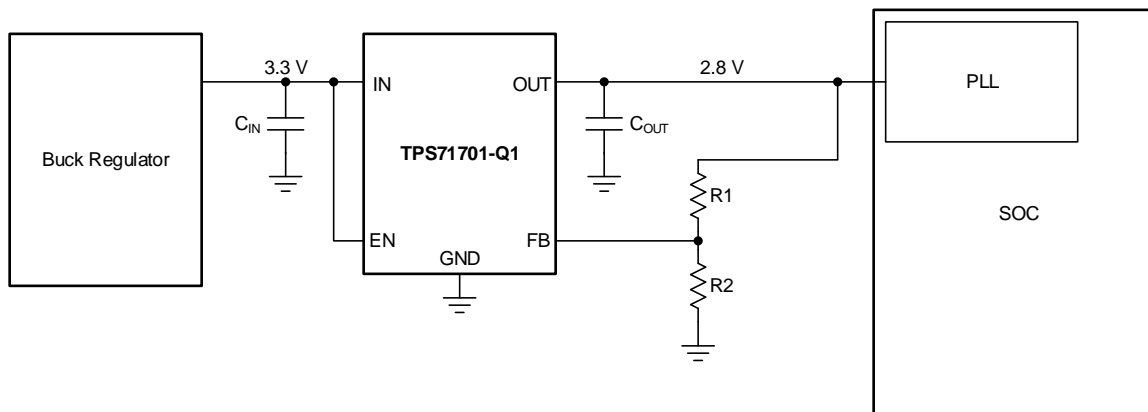

The value of R<sub>2</sub> directly affects the operation of the device and must be chosen in the range of approximately 160 kΩ to 332 kΩ. Sample resistor values for common output voltages are shown in Table 3.

**Table 3. Sample 1% Resistor Values For Common Output Voltages**

V <sub>OUT</sub>	R <sub>1</sub>	R <sub>2</sub>
1	80.6 kΩ	324 kΩ
1.2	162 kΩ	324 kΩ
1.5	294 kΩ	332 kΩ
1.8	402 kΩ	324 kΩ
2.5	665 kΩ	316 kΩ
3.3	1.02 MΩ	324 kΩ
5	1.74 MΩ	332 kΩ

### 8.2.2.2 Powering a PLL Integrated on an SOC

Figure 35 shows the TPS71701-Q1 powering a phase-locked loop (PLL) that is integrated into a system-on-a-chip (SOC).

**Figure 35. Typical Application Circuit: PLL on an SOC**

### 8.2.2.3 Design Considerations

Use the input and output capacitors to ensure the voltage transient requirements. A 1- $\mu\text{F}$  input and 1- $\mu\text{F}$  output capacitor are selected to maximize the capacitance and minimize capacitor size.

R2 is chosen to be 158 k $\Omega$  for optimal noise and PSRR, and by Equation 2, R1 is selected to be 402 k $\Omega$ . Both R1 and R2 must be 1% tolerance resistors to meet the dc accuracy specification over line, load, and temperature.

### 8.2.3 Application Curve

**Figure 36. Load Transient Response**

### 8.3 Do's and Don'ts

Do place at least one 1- $\mu\text{F}$  ceramic capacitor as close as possible to both the input and output pins of the LDO.

Do not place the output capacitor more than 10 mm away from the regulator.

Do not place any components in the feedback loop except for the input, output, and feed-forward capacitor and the feedback resistors.

Do not exceed the device absolute maximum ratings.

Do not float the enable (EN) pin.

## 9 Power Supply Recommendations

The TPS717-Q1 is designed to operate from an input voltage between 2.5 V and 6.5 V. The input supply must provide adequate headroom for the device to operate in a normal mode of operation.

Connect a low output impedance power supply directly to the IN pin of the TPS717-Q1. Inductive impedances between the input supply and the IN pin can create significant voltage excursions at the IN pin during startup or load transient events. If inductive impedances are unavoidable, use an input capacitor. To increase the overall PSRR of the power solution, use a pi-filter before the input of the LDO or after the FB network of the LDO.

## 10 Layout

### 10.1 Layout Guidelines

For best overall performance, place all circuit components on the same side of the circuit board and as near as practical to the respective LDO pin connections. Place ground return connections to the input and output capacitor, and to the LDO ground pin as close to the GND pin as possible, connected by wide, component-side, copper surface area. The use of vias and long traces to create LDO component connections is strongly discouraged and negatively affects system performance. This grounding and layout scheme minimizes inductive parasitics, and thereby reduces load-current transients, minimizes noise, and increases circuit stability. A ground reference plane is also recommended and is either embedded in the printed circuit board (PCB) itself or located on the bottom side of the PCB opposite the components. This reference plane serves to assure accuracy of the output voltage, shields the LDO from noise, and functions similar to a thermal plane to spread (or sink) heat from the LDO device when connected to the thermal pad. In most applications, this ground plane is necessary to meet thermal requirements.

#### 10.1.1 Board Layout Recommendations to Improve PSRR and Noise Performance

To improve ac performance (such as PSRR, output noise, and transient response), TI recommends that the board be designed with separate ground planes for  $V_{IN}$  and  $V_{OUT}$ , with each ground plane connected only at the GND pin of the device. In addition, the ground connection for the bypass capacitor must connect directly to the GND pin of the device.

### 10.2 Layout Examples

(1) Circles within thermal pad area indicate vias to other layers on the board.

**Figure 37. Fixed Voltage Layout**

**Layout Examples (continued)**

## 11 Device and Documentation Support

### 11.1 Device Support

#### 11.1.1 Development Support

##### 11.1.1.1 Evaluation Module

An evaluation module (EVM) is available to assist in the initial circuit performance evaluation using the TPS717. The [TPS717xxEVM-134 evaluation module](#) (and [related user guide](#)) can be requested at the Texas Instruments website through the product folders or purchased directly from the [TI eStore](#).

#### 11.1.2 Device Nomenclature

**Table 4. Device Nomenclature<sup>(1)</sup>**

PRODUCT	V <sub>OUT</sub>
TPS717xx(x)QYYz-Q1	<p><b>xx(x)</b> is the nominal output voltage. For output voltages with a resolution of 100 mV, two digits are used in the ordering number; otherwise, three digits are used (for example, 28 = 2.8 V; 125 = 1.25 V). An <b>01</b> denotes an adjustable voltage version.</p> <p><b>YYY</b> is the package designator.</p> <p><b>z</b> is the package quantity. R is for reel (3000 pieces), T is for tape (250 pieces).</p> <p><b>Q</b> and <b>-Q1</b> denote an automotive device that is qualified at grade 1.</p>

(1) For the most current package and ordering information see the Package Option Addendum at the end of this document, or visit the device product folder on [www.ti.com](http://www.ti.com).

## 11.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

<sup>(2)</sup> **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of  $\leq 1000$ ppm threshold. Antimony trioxide based flame retardants must also meet the  $\leq 1000$ ppm threshold requirement.

<sup>(3)</sup> **MSL, Peak Temp.** - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

<sup>(4)</sup> There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

<sup>(5)</sup> Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> **Lead/Ball Finish** - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

DCK (R-PDSO-G5)

PLASTIC SMALL-OUTLINE PACKAGE

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Body dimensions do not include mold flash or protrusion. Mold flash and protrusion shall not exceed 0.15 per side.
  - D. Falls within JEDEC MO-203 variation AA.

DCK (R-PDSO-G5)

PLASTIC SMALL OUTLINE

- NOTES:
- All linear dimensions are in millimeters.
  - This drawing is subject to change without notice.
  - Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
  - Publication IPC-7351 is recommended for alternate designs.
  - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.

## GENERIC PACKAGE VIEW

DRV 6

WSON - 0.8 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

Images above are just a representation of the package family, actual package may vary.  
Refer to the product data sheet for package details.

4206925/F

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

NOTES: (continued)

- This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 ([www.ti.com/lit/sluea271](http://www.ti.com/lit/sluea271)).
- Vias are optional depending on application, refer to device data sheet. If some or all are implemented, recommended via locations are shown.
