

NCP330

Soft-Start Controlled Load Switch

The NCP330 is a low $R_{DS(on)}$ N-channel MOSFET controlled by a soft-start sequence of 2 ms for mobile applications.

The very low $R_{DS(on)}$ allows system supplying or battery charging up to DC 3A. The device is enabled automatically if a Power Supply is connected on Vin pin (active High) and maintained off if no Vin (internal pull down).

Due to a current consumption optimization, leakage current is drastically decreased from the battery connected to the device, allowing long battery life.

Features

- 1.8 V – 5.5 V Operating Range
- 30 mΩ N-MOSFET
- DC Current Up to 3 A
- Peak Current Up to 5 A
- Built-in Soft-Start 2 ms
- Reverse Voltage Protection
- Active High with Integrated Bridge
- Compliance to IEC61000-4-2 (Level 4)
8.0 kV (Contact)
15 kV (Air)
- ESD Ratings: Machine Model = B
Human Body Model = 3
- μ DFN4 1.2 x 1.6 mm
- NCV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable
- This is a Pb-Free Device

Typical Applications

- Mobile Phones
- Tablets
- Digital Cameras
- GPS
- Computers

PIN FUNCTION DESCRIPTION

Pin Name	Pin Number	Type	Description
IN	1	POWER	Power-switch input voltage; connect a 1 μ F or greater ceramic capacitor from IN to GND as close as possible to the IC.
GND	2	POWER	Ground connection;
EN	3	INPUT	Enable input, logic high turns on power switch.
OUT	4	OUTPUT	Power-switch output; connect a 1 μ F ceramic capacitor from OUT to GND as close as possible to the IC is recommended.
PAD1		POWER	Exposed pad can be connected to GND plane for dissipation purpose or any other thermal plane.

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Guaranteed by design.
2. According to JEDEC standard JESD22-A108.
3. This device series contains ESD protection and passes the following tests:
Human Body Model (HBM) ± 2.0 kV per JEDEC standard: JESD22-A114 for all pins.
Machine Model (MM) ± 200 V per JEDEC standard: JESD22-A115 for all pins.
4. Latch up Current Maximum Rating: ± 100 mA per JEDEC standard: JESD78 class II.
5. Moisture Sensitivity Level (MSL): 1 per IPC/JEDEC standard: J-STD-020.

RECOMMENDED OPERATING CONDITIONS

FUNCTIONAL DESCRIPTION

Overview

The NCP330 is a high side N-channel MOSFET power distribution switch designed to connect external voltage directly to the system. The high side MOSFET is automatically turned on if the Vin voltage is applied thanks to internal pull up connected between Vin and EN pin. The turned off is obtained by Vin removal. Due to the soft start circuitry, NCP330 is able to limit large voltage surges.

Enable input

Enable pin is an active high. The part is off when Vin is not present, limiting current consumption from battery to OUT pin.

In the other side, the part is automatically turned on when VIN is applied.

Blocking Control

The blocking control circuitry switches the bulk of the power NMOS. When the part is off (No VIN or EN tied to GND externally), the body diode limits the leakage current IREV from OUT to IN. In this mode, anode of the body diode is connected to IN pin and cathode is connected to OUT pin. In operating condition, anode of the body diode is connected to OUT pin and cathode is connected to IN pin preventing the discharge of the power supply.

Cin Capacitor

A IN capacitor, 1 μF, at least, capacitor must be placed as close as possible the part to be Compliant with IEC61000-4-2 (Level 4).

Cout Capacitor

Depending on the sinking current during system start up and system turn off, a capacitor must be placed on the output. A 1 μF is strongly recommended but can be decreased down to 100 nF if the above two sequences are well controlled and parasitic inductance connected on the Vout line is negligible.

APPLICATION INFORMATION

Power Dissipation

The device's junction temperature depends on different contributor factor such as board layout, ambient temperature, device environment, etc... Yet, the main contributor in term of junction temperature is the power dissipation of the power MOSFET. Assuming this, the power dissipation and the junction temperature in normal mode can be calculated with the following equations:

$$P_D = R_{DS(on)} \times (I_{OUT})^2$$

P_D = Power dissipation (W)

$R_{DS(on)}$ = Power MOSFET on resistance (Ω)

I_{OUT} = Output current (A)

$$T_J = P_D \times R_{\theta JA} + T_A$$

T_J = Junction temperature ($^{\circ}C$)

$R_{\theta JA}$ = Package thermal resistance ($^{\circ}C/W$)

T_A = Ambient temperature ($^{\circ}C$)

PCB Recommendations

The NCP330 integrates an up to 3 A rated NMOS FET, and the PCB design rules must be respected to properly evacuate the heat out of the silicon. The μ DFN4 PAD1 must be connected to ground plane to increase the heat transfer if necessary. By increasing PCB area, the $R_{\theta JA}$ of the package can be decreased, allowing higher power dissipation.
