Note Accuracies listed are valid for up to one year from the device external calibration.

Table 5. AI Absolute Accuracy

Note Sensitivity is the smallest voltage change that can be detected. It is a function of noise.

Gain tempco	25 ppm/°C
Reference tempco	5 ppm/°C
INL error	76 ppm of range

AI Absolute Accuracy Equation

AbsoluteAccuracy = Reading · (GainError) + Range · (OffsetError) + NoiseUncertainty

- **GainError = ResidualAIGainError + GainTempco · (TempChangeFromLastInternalCal) + ReferenceTempco · (TempChangeFromLastExternalCal)**
- **OffsetError = ResidualAIOffsetError + OffsetTempco · (TempChangeFromLastInternalCal) + INLError**
- **NoiseUncertainty = $\frac{\text{Random Noise} \cdot 3}{\sqrt{100}}$**
for a coverage factor of 3 σ and averaging 100 points.

AI Absolute Accuracy Example

Absolute accuracy at full scale on the analog input channels is determined using the following assumptions:

- TempChangeFromLastExternalCal = 10 °C
- TempChangeFromLastInternalCal = 1 °C
- number_of_readings = 100
- CoverageFactor = 3 σ

For example, on the 10 V range, the absolute accuracy at full scale is as follows:

- GainError = 75 ppm + 25 ppm · 1 + 5 ppm · 10 = 150 ppm
- OffsetError = 20 ppm + 57 ppm · 1 + 76 ppm = 153 ppm
- NoiseUncertainty =
$$\frac{244 \mu\text{V} \cdot 3}{\sqrt{100}}$$
 = 73 μV
- AbsoluteAccuracy = 10 V · (GainError) + 10 V · (OffsetError) + NoiseUncertainty = 3,100 μV

Channel-to-earth	11 V, Measurement Category I
------------------	------------------------------

Measurement Category I is for measurements performed on circuits not directly connected to the electrical distribution system referred to as MAINS voltage. MAINS is a hazardous live electrical supply system that powers equipment. This category is for measurements of voltages from specially protected secondary circuits. Such voltage measurements include signal levels, special equipment, limited-energy parts of equipment, circuits powered by regulated low-voltage sources, and electronics.

Caution Do not use for measurements within Categories II, III, or IV.

Note Measurement Categories CAT I and CAT O (Other) are equivalent. These test and measurement circuits are not intended for direct connection to the MAINS building installations of Measurement Categories CAT II, CAT III, or CAT IV.

Device Pinouts

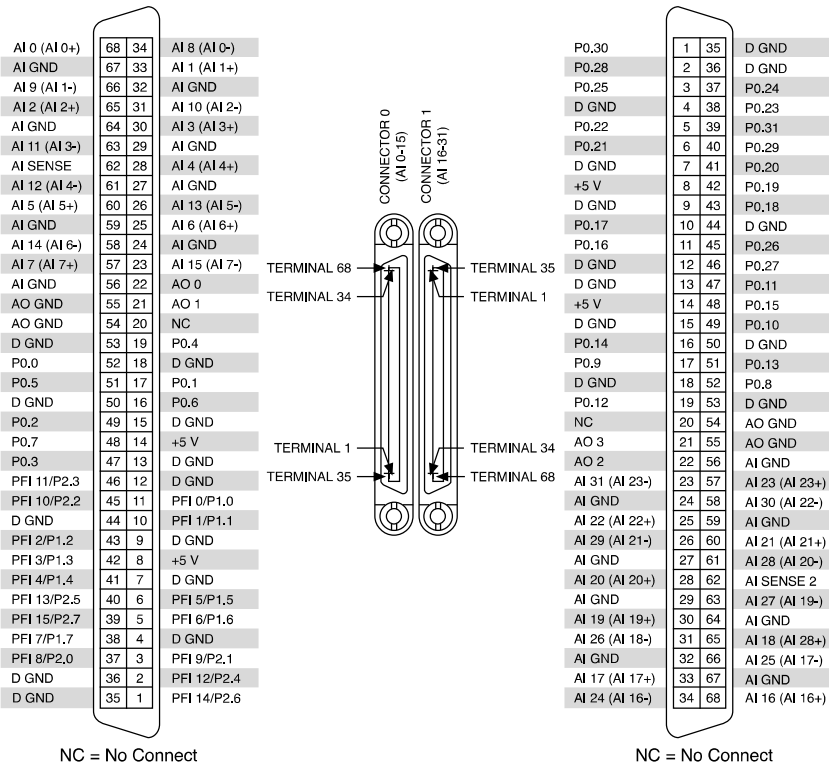

Figure 9. NI USB-6229 Screw Terminal Pinout

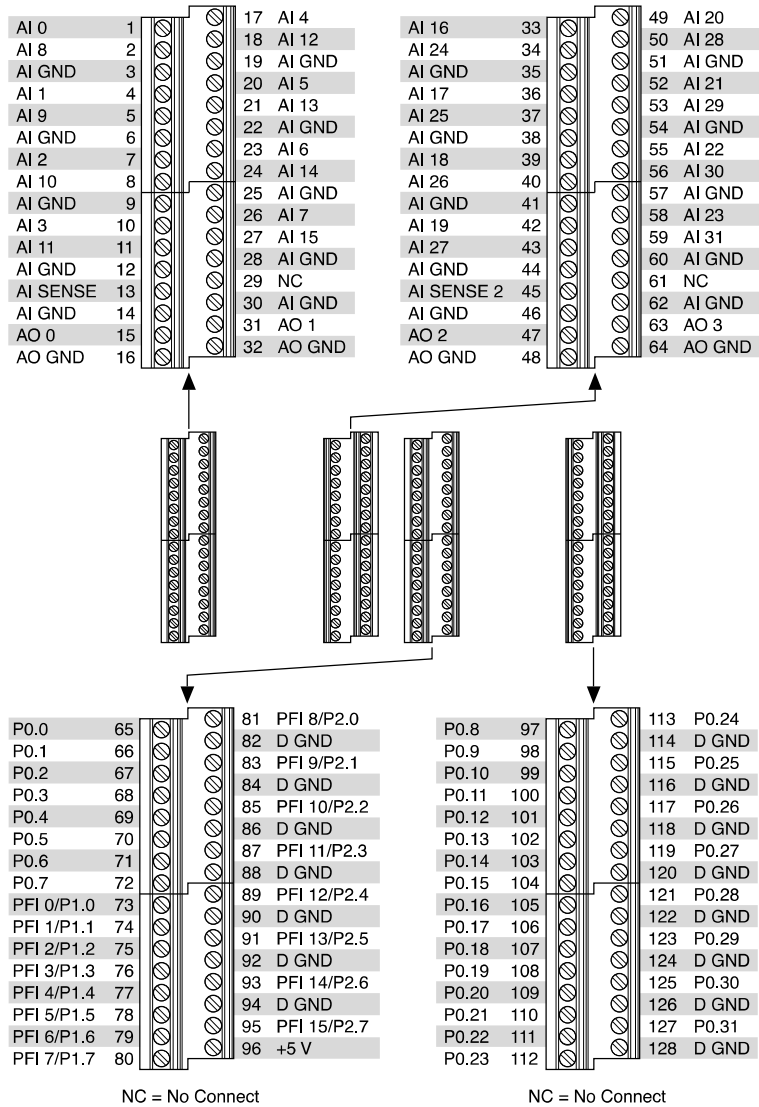

Figure 10. NI USB-6229 BNC Top Panel and Pinout

1 When the USB Screw Terminal device is powered on, the analog output signal is not defined until after USB configuration is complete.

2 Stresses beyond those listed under **Input voltage protection** may cause permanent damage to the device.

3 The digital subsystem does not have its own dedicated internal timing engine. Therefore, a sample clock must be provided from another subsystem on the device or an external source.

4 In other sections of this document, RTSI refers to RTSI <0..7> for the PCI devices or PXI_TRIG <0..7> for PXI devices.

⁵ If you are using an USB M Series device in full-speed mode, device performance will be lower and you will not be able to achieve maximum sample/update rates.

⁶ Operating on a full-speed bus may result in lower performance.

⁷ Does not include P0/PFI/P1/P2 and +5 V terminals.

⁸ Older revisions have a self-resetting fuse that opens when current exceeds this specification. Newer revisions have a traditional fuse that opens when current exceeds this specification. This fuse is not customer-replaceable; if the fuse permanently opens, return the device to NI for repair.
