

### Description

The ICS557-01 is a clock chip designed for use in PCI-Express Cards as a clock source. It provides a pair of differential outputs at 100 MHz in a small 8-pin SOIC package.

Using IDT's patented Phase-Locked Loop (PLL) techniques, the device takes a 25 MHz crystal input and produces HCSL (Host Clock Signal Level) differential outputs at 100 MHz clock frequency. LVDS signal levels can also be supported via an alternative termination scheme.

### Features

- Supports PCI-Express™ HCSL Outputs 0.7 V current mode differential pair
- Supports LVDS Output Levels
- Packaged in 8-pin SOIC
- RoHS 5 (green) or RoHS 6 (green and lead free) compliant packaging
- Operating voltage of 3.3 V
- Low power consumption
- Input frequency of 25 MHz
- Short term jitter 100 ps (peak-to-peak)
- Output Enable via pin selection
- Industrial temperature range available
- **For PCIe Gen2 applications, see the 5V41064**
- **For PCIe Gen3 applications, see the 5V41234**

## Pin Descriptions

Pin Number	Pin Name	Pin Type	Pin Description
1	OE	Input	Output Enable signal (H = outputs are enabled, L = outputs are disabled/tristated). Internal pull-up resistor.
2	X1	Input	Crystal or clock input. Connect to a 25 MHz crystal or single ended clock.
3	X2	XO	Crystal Connection. Connect to a parallel mode crystal. Leave floating if clock input.
4	GND	Power	Connect to ground.
5	IREF	Output	A 475Ω precision resistor connected between this pin and ground establishes the external reference current.
6	CLK	Output	HCSL differential complementary clock output.
7	CLK	Output	HCSL differential clock output.
8	VDD	Power	Connect to +3.3 V.

## Applications Information

### External Components

A minimum number of external components are required for proper operation.

### Decoupling Capacitors

Decoupling capacitors of 0.01  $\mu\text{F}$  should be connected between VDD and the ground plane (pin 4) as close to the VDD pin as possible. Do not share ground vias between components. Route power from power source through the capacitor pad and then into IDT pin.

### Crystal

A 25 MHz fundamental mode parallel resonant crystal with  $C_L = 16$  pF should be used. This crystal must have less than 300 ppm of error across temperature in order for the ICS557-01 to meet PCI Express specifications.

### Crystal Capacitors

Crystal capacitors are connected from pins X1 to ground and X2 to ground to optimize the accuracy of the output frequency.

$C_L$  = Crystal's load capacitance in pF

Crystal Capacitors (pF) =  $(C_L - 8) * 2$

For example, for a crystal with a 16 pF load cap, each external crystal cap would be 16 pF.  $(16-8)*2=16$ .

Current Source (Iref) Reference Resistor -  $R_R$

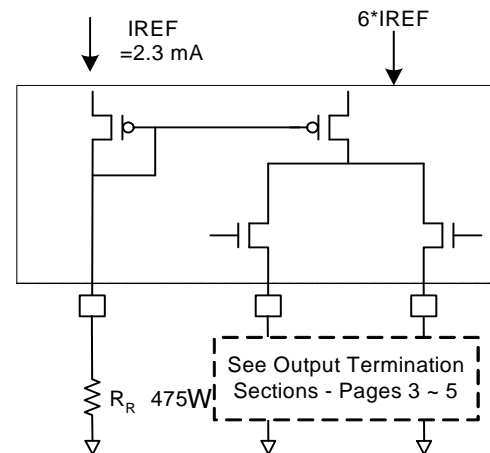

If board target trace impedance (Z) is 50 $\Omega$ , then  $R_R = 475\Omega$  (1%), providing IREF of 2.32 mA. The output current ( $I_{OH}$ ) is equal to 6\*IREF.

### Output Termination

The PCI-Express differential clock outputs of the ICS557-01 are open source drivers and require an external series resistor and a resistor to ground. These resistor values and their allowable locations are shown in detail in the **PCI-Express Layout Guidelines** section.

The ICS557-01 can also be configured for LVDS compatible voltage levels. See the LVDS Compatible Layout Guidelines section

## Output Structures

### General PCB Layout Recommendations

For optimum device performance and lowest output phase noise, the following guidelines should be observed.

1. Each 0.01  $\mu\text{F}$  decoupling capacitor should be mounted on the component side of the board as close to the VDD pin as possible.
2. No vias should be used between decoupling capacitor and VDD pin.
3. The PCB trace to VDD pin should be kept as short as possible, as should the PCB trace to the ground via. Distance of the ferrite bead and bulk decoupling from the device is less critical.
4. An optimum layout is one with all components on the same side of the board, minimizing vias through other signal layers (any ferrite beads and bulk decoupling capacitors can be mounted on the back). Other signal traces should be routed away from the ICS557-01. This includes signal traces just underneath the device, or on layers adjacent to the ground plane layer used by the device.

## Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the ICS557-01. These ratings are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

Item	Rating
