

Current Mode PWM Controller

Description

The SG1842/43 family of control IC's provides all the necessary features to implement off-line fixed frequency, current-mode switching power supplies with a minimum number of external components.

Current-mode architecture demonstrates improved line regulation, improved load regulation, pulse-by-pulse current limiting and inherent protection of the power supply output switch. The bandgap reference is trimmed to $\pm 1\%$ over temperature.

Oscillator discharge current is trimmed to less than $\pm 10\%$. The SG1842/43 has under-voltage lockout, current limiting circuitry and start-up current of less than 1mA. The totem-pole output is optimized to drive the gate of a power MOSFET. The output is low in the off state to provide direct interface to an N-channel device. The SG1842/43 is specified for operation over the full military ambient temperature range of -55°C to 125°C . The SG2842/43 is specified for the industrial range of -25°C to 85°C , and the SG3842/43 is designed for the commercial range of 0°C to 70°C .

Features

- Optimized For Off-Line Control
- Low Start-Up Current ($<1\text{mA}$)
- Automatic Feed Forward Compensation
- Trimmed Oscillator Discharge Current
- Pulse-By-Pulse Current Limiting
- Enhanced Load Response Characteristics
- Under-Voltage Lockout with 6V Hysteresis (SG1842 only)
- Double-Pulse Suppression
- High-Current Totem-Pole Output (1 \$ Peak)
- Internally Trimmed Bandgap Reference
- 500kHz Operation
- Undervoltage Lockout
SG1842 - 16 volts
SG1843 - 8.4 volts
- Low Shoot-Through Current $<75\text{mA}$ Over Temperature

Application

- Available To MIL-STD – 883, ¶ 1.2.1
- Available to DSCC
- Standard Microcircuit Drawing (SMD)

<i>Note: Range over which the device is functional.</i>					

Electrical Characteristics

Unless otherwise specified, these specifications apply over the operating ambient temperatures for SG1842/SG1843 with $-55^{\circ}\text{C} \leq T_A \leq 125^{\circ}\text{C}$, SG2842/SG2843 with $-25^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$, SG3842/SG3843 with $0^{\circ}\text{C} \leq T_A \leq 70^{\circ}\text{C}$, $V_{CC} = 15\text{V}$, $R_T = 10\text{k}\Omega$, and $C_T = 3.3\text{nF}$. Low duty cycle pulse testing techniques are used which maintains junction and case temperatures equal to the ambient temperature.

Application Information

The oscillator of the 1842/43 family of PWM's is designed such that many values of R_T and C_T will give the same oscillator frequency, but only one combination will yield a specific duty cycle at a given frequency.

Given:

Frequency $\equiv f$

Maximum Duty Cycle $\equiv D_m$

Calculate: $R_T = 267 \left[\frac{(1.76)^{1/D_m - 1}}{(1.76)^{(1 - D_m)/D_m - 1}} \right] (\Omega)$

where $0.3 < D_m < 0.95$

$$C_T = \frac{1.86 * D_m}{f * R_T} (\mu F)$$

For Duty-Cycles above 95% use:

Figure 15 - Oscillator Timing Circuit

A set of formulas are given to determine the values of R_T and C_T for a given frequency and maximum duty cycle. (Note: These formulas are less accurate for smaller duty cycles or higher frequencies. This will require trimming of R_T or C_T to correct for this error.)

Example:

A Flyback power supply requires a maximum of 45% duty cycle at a switching frequency of 50 kHz. What are the values of R_T and C_T ?

Given:

$f = 50\text{kHz}$

$D_m = 0.45$

Calculate: $R_T = 267 \left[\frac{(1.76)^{\frac{1}{.55}} - 1}{(1.76)^{.45} - 1} \right] = 674 \Omega$

$$C_T = \frac{1.86 * 0.45}{50000 * 674} = .025 (\mu\text{F})$$

Figure 16 - Oscillator Frequency Vs. R_T For Various C_T

Typical Application Circuits

Pin numbers referenced are for 8-pin package and pin numbers in parenthesis are for 14-pin package.

Figure 17 • Current Sense Spike Suppression

The RC low-pass filter eliminates the leading edge current spike caused by parasitic of Power MOSFET.

Figure 18 • MOSFET Parasitic Oscillations

A resistor (R1) in series with the MOSFET gate reduce overshoot and ringing caused by the MOSFET input capacitance and any inductance in series with the gate drive. (Note: It is very important to have a low inductance ground path to insure correct operation of the I.C. This can be done by making the ground paths as short and as wide as possible.)

Figure 19 - Bipolar Transistor Drive

The 1842/43 output stage can provide negative base current to remove base charge of power transistor (Q_1) for faster turn off. This is accomplished by adding a capacitor (C_1) in parallel with a resistor (R_1). The resistor (R_1) is to limit the base current during turn on.

Figure 20 - Isolated MOSFET Drive

Current transformers can be used where isolation is required between PWM and Primary ground. A drive transformer is then necessary to interface the PWM output with the MOSFET.

Figure 21 • Adjustable Buffered Reduction of Clamp Level with Softstart

$$I_{PK} = \frac{V_{CS}}{R_S}$$

Where, $V_{CS} = 1.67 \left(\frac{R_1}{R_1 + R_2} \right)$ and $V_{C.S.MAX} = 1V$ (Typ.)

$$t_{SOFTSTART} = -\ln \left[1 - \frac{V_{EAO} - 1.3}{5 \left(\frac{R_1}{R_1 + R_2} \right)} \right] \left(\frac{R_1 R_2}{R_1 + R_2} \right) C$$

Where, $V_{EAO} \equiv$ voltage at the Error Amp Output under minimum line and maximum load conditions
Softstart and adjustable peak current can be done with the external circuitry shown above.

$$f = \frac{1.44}{(R_A + 2R_B) C}$$

$$f = \frac{R_B}{R_A + 2R_B}$$

Figure 22 • External Duty Cycle Clamp and Multi-Unit Synchronization

Precision duty cycle limiting as well as synchronizing several 1842/1843's is possible with the above circuitry.

Figure 23 - Oscillator Connection

The oscillator is programmed by the values selected for the timing components R_T and C_T . Refer to application information for calculation of the component values.

Figure 24 - Error Amplifier Connection

Error amplifier is capable of sourcing and sinking current up to 0.5mA.

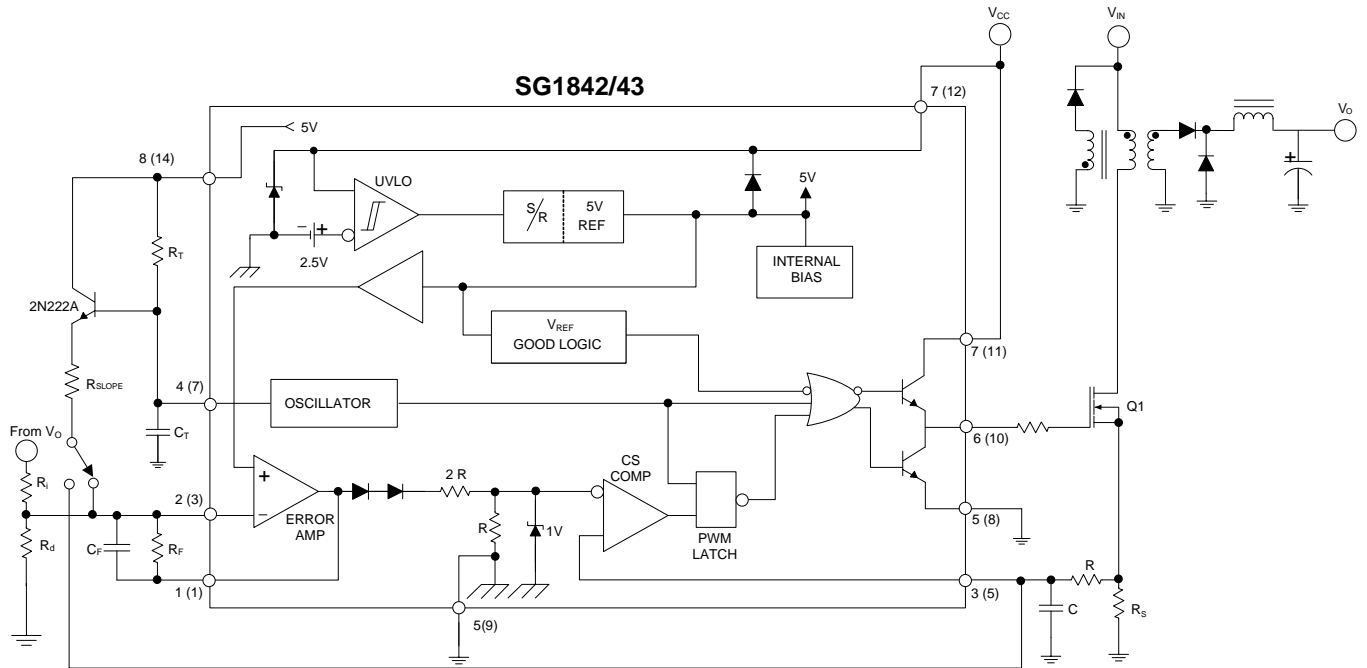

Figure 25 • Slope Compensation

Due to inherent instability of current mode converters running above 50% duty cycle, slope compensation should be added to either current sense pin or the error amplifier. Figure 25 shows a typical slope compensation technique.

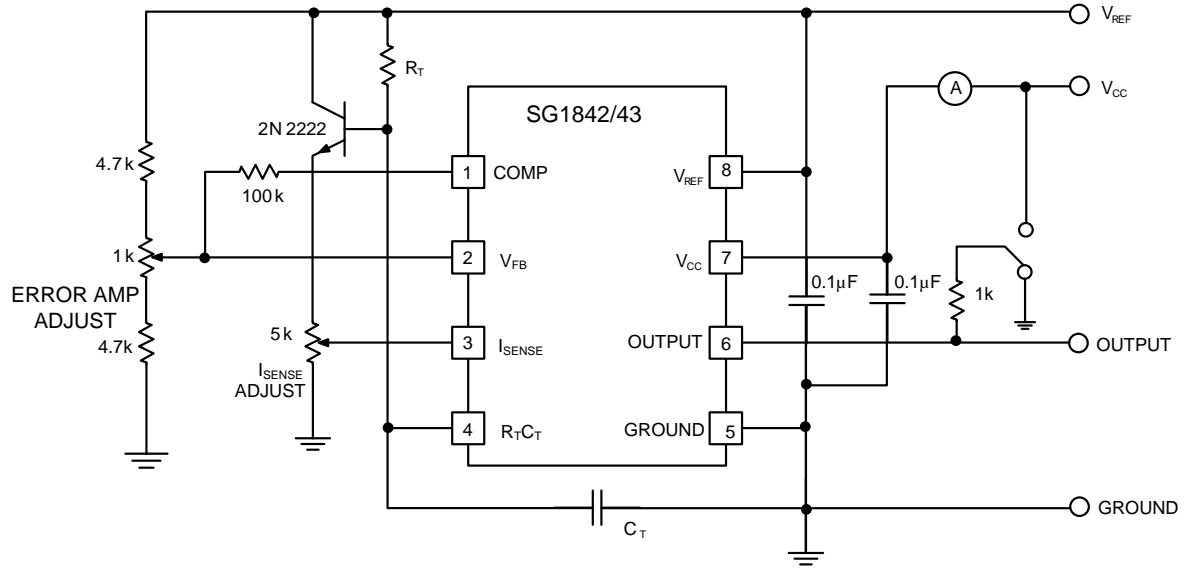

Figure 26 - Open Loop Laboratory Fixture

High-peak currents associated with capacitive loads necessitate careful grounding techniques. Timing and bypass capacitors should be connected to pin 5 in a single point ground.

The transistor and 5kΩ potentiometer are used to sample the oscillator waveform and apply an adjustable ramp to pin 3.

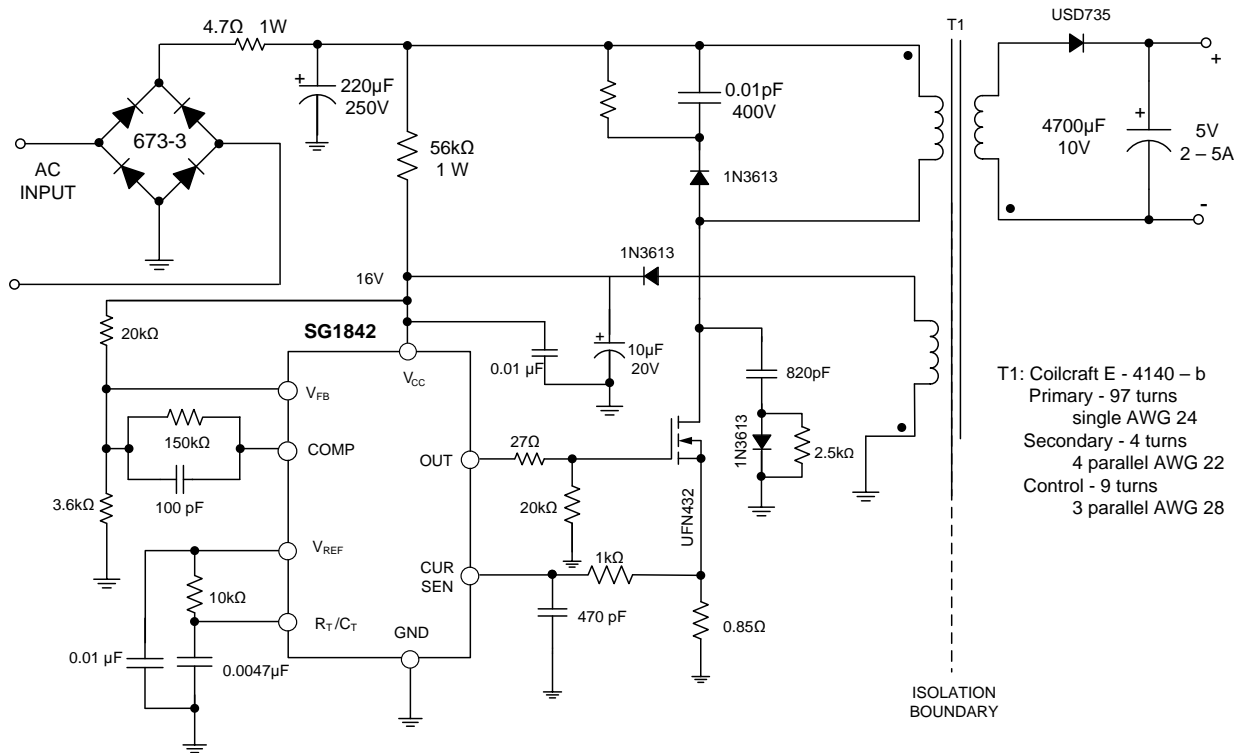

Figure 27 - Off-line Flyback Regulator

SPECIFICATIONS

Input line voltage:	90VAC to 130VAC
Input frequency:	50 or 60Hz
Switching frequency:	40kHz \pm 10%
Output power:	25W maximum
Output voltage:	5V +5%
Output current:	2 to 5A
Line regulation:	0.01%/V
Load regulation:	8%/A*
Efficiency @ 25 Watt:	
$V_{IN} = 90VAC$:	70%
$V_{IN} = 130VAC$:	65%
Output short-circuit current:	2.5 A average

*This circuit uses a low-cost feedback scheme in which the DC voltage developed from the primary-side control winding is sensed by the SG1842 error amplifier. Load regulation is therefore dependent on the coupling between secondary and control windings, and on transformer leakage inductance.

1. Lead No. 1 is identified by tab on lead or dot on cover.
2. Leads are within 0.13mm (.0005") radius of the true position (TP) at maximum material condition.
3. Dimension "e" determines a zone within which all body and lead irregularities lie.

Figure 7 - F 10-Pin Ceramic Flatpack Package Dimensions

Dim	MILLIMETERS		INCHES	
	MIN	MAX	MIN	MAX
