

BCK16-8MM-1/4"-A

Ruland BCK16-8MM-1/4"-A, 8mm x 1/4" Bellows Coupling, Aluminum, Clamp Style With Keyway, 1.000" (25.4mm) OD, 1.345" (34.2mm) Length

Description

Ruland BCK16-8MM-1/4"-A is a clamp bellows coupling with 8mm x 0.2500" bores, 1.000" (25.4mm) OD, 1.345" (34.2mm) length and 2mm keyway on the 8mm bore and no keyway on the 1/4" bore. It is zero-backlash and has a balanced design for reduced vibration at high speeds. BCK16-8MM-1/4"-A is comprised of two anodized aluminum hubs and a stainless steel bellows. The bellows are able to flex while remaining rigid under torsional loads allowing for all types of misalignment to be accommodated. This bellows coupling is lightweight and has low inertia making it suitable for applications with speeds up to 10,000 RPM. Hardware is metric and tests beyond DIN 912 12.9 standards for maximum torque capabilities. Ruland BCK16-8MM-1/4"-A has four convolutions allowing for high torsional rigidity and making it an excellent fit for precise positioning stepper servo applications as well as encoders. It is machined from solid bar stock that is sourced exclusively from North American mills and RoHS3 and REACH compliant. BCK16-8MM-1/4"-A is carefully manufactured in our Marlborough, MA factory under strict controls using proprietary processes.

Note 2	Torque ratings are at maximum misalignment.		
Note 3	Performance ratings are for guidance only. The user must determine suitability for a particular application.		
Note 4			ilure point of the metal bellows. Unde d torque of the metal bellows. In some

	cases, especially when the smallest standard bores are used or where shafts are undersized, slippage on the shaft is possible below the rated torque of the metal bellows. Keyways are available to provide additional torque capacity in the shaft/hub connection when required. Please consult technical support for more assistance.

Installation Instructions		
	 Align the bores of the BCK16-8MM-1/4"-A bellows coupling on the shafts that are to be joined and determine if the misalignment parameters are within the limits of the coupling. (<i>Angular Misialignment:</i> 1.5°, <i>Parallel Misalignment:</i> 0.004 in (0.10 mm), <i>Axial Motion:</i> 0.012 in (0.30 mm)) Fully tighten the M3 screw on the first hub to the recommended seating torque of 2.1 Nm using a 2.5 mm hex torque wrench. Before tightening the screw on the second hub, rotate the coupling by hand to allow it to reach its 	
	free length.	
	 Tighten the screw on the second hub to the recommended seating torque. Make sure the coupling remains axially relaxed and the misalignment angle remains centered along the length of the coupling.
