

## FEATURES

- Filterless digital Class-D amplifier**
- Pulse density modulation (PDM) digital input interface**
- 2.7 W into 4 Ω load and 1.4 W into 8 Ω load at 5.0 V supply with <1% total harmonic distortion plus noise (THD + N)**
- Available in 9-ball, 1.2 mm × 1.2 mm, 0.4 mm pitch WLCSP**
- 93% efficiency into 8 Ω at full scale**
- Output noise: 25 μV rms at 3.6 V, A-weighted**
- THD + N: 0.005% at 1 kHz, 100 mW output power**
- PSRR: 80 dB at 217 Hz, with dither input**
- Quiescent power consumption: 5.1 mW (VDD = 1.8 V, PVDD = 3.6 V, 8 Ω + 33 μH load)**
- Pop-and-click suppression**
- Configurable with PDM pattern inputs**
- Short-circuit and thermal protection with autorecovery**
- Smart power-down when PDM stop condition or no clock input detected**
- 64 × f<sub>s</sub> or 128 × f<sub>s</sub> operation supporting 3 MHz and 6 MHz clocks**
- DC blocking high-pass filter and static input dc protection**
- User-selectable ultralow EMI emissions and low latency modes**
- Power-on reset (POR)**
- Minimal external passive components**

## APPLICATIONS

### Mobile handsets

## GENERAL DESCRIPTION

The *SSM2537* is a PDM digital input Class-D power amplifier that offers higher performance than existing DAC plus Class-D solutions. The *SSM2537* is ideal for power sensitive applications where system noise can corrupt the small analog signal sent to the amplifier, such as mobile phones and portable media players.

The *SSM2537* combines an audio digital-to-analog converter (DAC), a power amplifier, and a PDM digital interface on a single chip. The integrated DAC plus analog sigma-delta ( $\Sigma$ - $\Delta$ ) modulator

architecture enables extremely low real-world power consumption from digital audio sources with excellent audio performance. Using the *SSM2537*, audio can be transmitted digitally to the audio amplifier, significantly reducing the effect of noise sources such as GSM interference or other digital signals on the transmitted audio. The *SSM2537* is capable of delivering 2.7 W of continuous output power with <1% THD + N driving a 4 Ω load from a 5.0 V supply.

The *SSM2537* features a high efficiency, low noise modulation scheme that requires no external LC output filters. The closed-loop, three-level modulator design retains the benefits of an all-digital amplifier, yet enables very good PSRR and audio performance. The modulation continues to provide high efficiency even at low output power and has an SNR of 102 dB PDM input. Spread-spectrum pulse density modulation is used to provide lower EMI-radiated emissions compared with other Class-D architectures.

The *SSM2537* has a four-state gain and sample frequency selection pin that can select two different gain settings, optimized for 3.6 V and 5 V operation. This same pin controls the internal digital filtering and clocking, which can be set for a 64 × f<sub>s</sub> or 128 × f<sub>s</sub> input sample rate to support both 3 MHz and 6 MHz PDM clock rates.

The *SSM2537* has a micropower shutdown mode with a typical shutdown current of 1.6 μA for both power supplies. Shutdown is enabled automatically by gating input clock and data signals. A standby mode can be entered by applying a designated PDM stop condition sequence. The device also includes pop-and-click suppression circuitry. This suppression circuitry minimizes voltage glitches at the output when entering or leaving the low power state, reducing audible noises on activation and deactivation.

The *SSM2537* is specified over the industrial temperature range of -40°C to +85°C. It has built-in thermal shutdown and output short-circuit protection. It is available in a 9-ball, 1.2 mm × 1.2 mm wafer level chip scale package (WLCSP).

## ABSOLUTE MAXIMUM RATINGS

Absolute maximum ratings apply at 25°C, unless otherwise noted.

Table 4.

Parameter	Rating
PVDD Supply Voltage	-0.3 V to +6 V
VDD Supply Voltage	-0.3 V to +2 V
Input Voltage (Signal Source)	-0.3 V to +2 V
ESD Susceptibility	4 kV
OUT- and OUT+ Pins	8 kV
Storage Temperature Range	-65°C to +150°C
Operating Temperature Range	-40°C to +85°C
Junction Temperature Range	-65°C to +165°C
Lead Temperature (Soldering, 60 sec)	300°C

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## THERMAL RESISTANCE

Junction-to-air thermal resistance ( $\theta_{JA}$ ) is specified for the worst-case conditions, that is, a device soldered in a printed circuit board (PCB) for surface-mount packages.  $\theta_{JA}$  is determined according to JEDEC JESD51-9 on a 4-layer PCB with natural convection cooling.

Table 5. Thermal Resistance

Package Type	PCB	$\theta_{JA}$	Unit
9-Ball, 1.2 mm × 1.2 mm WLCSP	250P	88	°C/W

## ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Figure 3. Pin Configuration

Table 6. Pin Function Descriptions

Pin No.	Mnemonic	Function	Description
A1	PDAT	Input	PDM Data Signal.
A2	LRSEL	Input	Left/Right Channel Select. Tie to ground for left channel; pull up to VDD for right channel.
A3	OUT-	Output	Inverting Output.
B1	VDD	Supply	Digital Power, 1.8 V.
B2	PVDD	Supply	Amplifier Power, 2.5 V to 5.5 V.
B3	PGND	Ground	Amplifier Ground.
C1	PCLK	Input	PDM Interface Master Clock.
C2	GAIN_FS	Input	Gain and Sample Rate Selection Pin. (Connect to PVDD for typical operation.)
C3	OUT+	Output	Noninverting Output.

## THEORY OF OPERATION

### MASTER CLOCK

The [SSM2537](#) requires a clock present at the PCLK input pin to operate. This clock must be fully synchronous with the incoming digital audio on the serial interface. Clock frequencies must fall into one of these ranges: 1.84 MHz to 3.23 MHz or 3.68 MHz to 6.46 MHz.

### POWER SUPPLIES

The [SSM2537](#) requires two power supplies: PVDD and VDD.

#### PVDD

PVDD supplies power to the full-bridge power stage of the MOSFET and its associated drive, control, and protection circuitry. It also supplies power to the digital-to-analog converter (DAC) and to the Class-D PDM modulator. PVDD can operate from 2.5 V to 5.5 V and must be present to obtain audio output. Lowering the supply voltage of PVDD results in lower maximum output power and, therefore, lower power consumption.

#### VDD

VDD provides power to the digital logic circuitry. VDD can operate from 1.65 V to 1.95 V and must be present to obtain audio output. Lowering the supply voltage of VDD results in lower power consumption but does not affect audio performance.

### POWER CONTROL

On device power-up, PVDD must first be applied to the device, which latches in the designated GAIN\_FS pin functionality.

The [SSM2537](#) contains a smart power-down feature. When enabled, the smart power-down feature looks at the incoming digital audio and, if it receives the PDM stop condition of at least 129 repeated 0xAC bytes (1024 clock cycles), it places the [SSM2537](#) in standby mode. In standby mode, PCLK can be removed, resulting in a full power-down state. This state is the lowest power condition possible. When PCLK is turned on again and a single non-stop condition input is received, the [SSM2537](#) leaves the full power-down state and resumes normal operation under the default setting as indicated by the GAIN\_FS pin state.

### POWER-ON RESET/VOLTAGE SUPERVISOR

The [SSM2537](#) includes an internal power-on reset and voltage supervisor circuit. This circuit provides an internal reset to S<sup>Λ</sup>circuitry when PVDD or VDD is substantially below the nominal operating threshold. This simplifies supply sequencing during initial power-on.

The circuit also monitors the power supplies to the IC. If the supply voltages fall below the nominal operating threshold, this circuit stops the output and issues a reset. This is done to ensure that no damage occurs due to low voltage operation and that no pops can occur under nearly any power removal condition.

### SYSTEM GAIN/INPUT FREQUENCY

The GAIN\_FS pin is used to set the internal gain and filtering configuration for different sample rates of the [SSM2537](#). This pin can be set to one of four states by connecting the pin either to PVDD or to PGND with or without a 47 kΩ resistor (see Table 7). The internal gain and filtering can also be set via PDM pattern control, allowing these settings to be modified during operation (see the PDM Pattern Control section).

The [SSM2537](#) has an internal analog gain control such that when GAIN\_FS is tied to PGND or PVDD via a 47 kΩ resistor (5 V gain setting), a –6.02 dBFS PDM input signal results in an amplifier output voltage of 5 V peak. This setting should produce optimal noise performance when PVDD is 5 V.

When the GAIN\_FS pin is tied to PVDD or pulled directly to PGND, the gain is adjusted so that a –6.02 dBFS PDM input signal results in an amplifier output voltage of 3.6 V peak. This setting should produce optimal noise performance when PVDD is 3.6 V.

The [SSM2537](#) can handle input sample rates of  $64 \times f_s$  (~3 MHz) and  $128 \times f_s$  (~6 MHz). Different internal digital filtering is used in each of these cases. Selection of the sample rate is also set via the GAIN\_FS pin (see Table 7).

Because the  $64 \times f_s$  mode provides better performance with lower power consumption, its use is recommended. The  $128 \times f_s$  mode should be used only when overall system noise performance is limited by the source modulator.

**Table 7. GAIN\_FS Function Descriptions**

Device Setting	GAIN_FS Pin Configuration
$f_s = 128 \times \text{PCLK}$ , Gain = 5 V	Pull up to PVDD with a 47 kΩ resistor
$f_s = 64 \times \text{PCLK}$ , Gain = 5 V	Pull down to PGND with a 47 kΩ resistor
$f_s = 128 \times \text{PCLK}$ , Gain = 3.6 V	Pull up to PVDD
$f_s = 64 \times \text{PCLK}$ , Gain = 3.6 V	Pull down to PGND

## PDM PATTERN CONTROL

The [SSM2537](#) has a simple control mechanism that can set the part for low power states and control functionality. This is accomplished by sending a repeating 8-bit pattern to the device. Different patterns set different functionality (see Table 8).

Any pattern must be repeated a minimum of 129 times. The part is automatically muted when a pattern is detected so that a pattern can be set while the part is operational without a pop/click due to pattern transition.

All functionality set via patterns returns to its default values after a clock-loss power-down.

**Table 8. PDM Watermarking Pattern Control Descriptions**

Pattern	Control Description
0xD2	Gain optimized for PVDD = 3.6 V operation.
0xD4	Gain optimized for PVDD = 2.5 V operation.
0xD8	Gain optimized for PVDD = 5 V operation.
0xE1	Ultralow EMI mode.
0xE2	Low latency mode with pattern delay (~15 $\mu$ s latency).
0xE4	$f_s$ set to opposite value determined by GAIN_FS pin.
0xAA	Device reset: Place device into default configuration.
0x66	Mute.
0xAC	Power-down: All blocks off except for PDM interface. Normal start-up time.

## EMI NOISE

The [SSM2537](#) uses a proprietary modulation and spread-spectrum technology to minimize EMI emissions from the device. For applications that have difficulty passing FCC Class B emission tests, the [SSM2537](#) includes a modulation select mode (ultralow EMI emissions mode) that significantly reduces the radiated emissions at the Class-D outputs, particularly above 100 MHz. This mode is enabled by activating PDM Watermarking Pattern 0xE1 (see Table 8).

## PDM CHANNEL SELECTION

The [SSM2537](#) includes a left/right input select pin, LRSEL (see Table 9), that determines which of the time-multiplexed input streams is routed to the amplifier. To select the left input channel, connect LRSEL to PGND. To select the right channel, connect LRSEL to VDD. At any point during amplifier operation, the logic level applied to LRSEL may be changed and the output will switch the input streams without audible artifacts. No muting, watermarking pattern or synchronizing are necessary to achieve a click/pop free LRSEL transition.

**Table 9. LRSEL Pin Function Descriptions**

Device Setting	LRSEL Pin Configuration
Right Channel Select	VDD
Left Channel Select	PGND

## OUTPUT MODULATION DESCRIPTION

The [SSM2537](#) uses three-level,  $\Sigma$ - $\Delta$  output modulation. Each output can swing from PGND to PVDD and vice versa. Ideally, when no input signal is present, the output differential voltage is 0 V because there is no need to generate a pulse. In a real-world situation, there are always noise sources present.

Due to this constant presence of noise, a differential pulse is generated, when required, in response to this stimulus. A small amount of current flows into the inductive load when the differential pulse is generated.

Most of the time, however, the output differential voltage is 0 V, due to the Analog Devices, Inc., three-level,  $\Sigma$ - $\Delta$  output modulation. This feature ensures that the current flowing through the inductive load is small.

When the user wants to send an input signal, an output pulse (OUT+ and OUT-) is generated to follow the input voltage. The differential pulse density (VOUT) is increased by raising the input signal level. Figure 33 depicts three-level,  $\Sigma$ - $\Delta$  output modulation with and without input stimulus.

Figure 33. Three-Level,  $\Sigma$ - $\Delta$  Output Modulation With and Without Input Stimulus

## APPLICATIONS INFORMATION

### LAYOUT

As output power increases, take care to lay out PCB traces and wires properly among the amplifier, load, and power supply. A good practice is to use short, wide PCB tracks to decrease voltage drops and minimize inductance. Avoid ground loops where possible to minimize common-mode current associated with separate paths to ground. Ensure that track widths are at least 200 mil per inch of track length for the lowest DCR, and use 1 oz or 2 oz copper PCB traces to further reduce IR drops and inductance. A poor layout increases voltage drops, consequently affecting efficiency. Use large traces for the power supply inputs and amplifier outputs to minimize losses due to parasitic trace resistance.

Proper grounding helps to improve audio performance, minimize crosstalk between channels, and prevent switching noise from coupling into the audio signal. To maintain high output swing and high peak output power, the PCB traces that connect the output pins to the load, as well as the PCB traces to the supply pins, should be as wide as possible to maintain the minimum trace resistances. It is also recommended that a large ground plane be used for minimum impedances.

In addition, good PCB layout isolates critical analog paths from sources of high interference. Separate high frequency circuits (analog and digital) from low frequency circuits.

Properly designed multilayer PCBs can reduce EMI emissions and increase immunity to the RF field by a factor of 10 or more, compared with double-sided boards. A multilayer board allows a complete layer to be used for the ground plane, whereas the ground plane side of a double-sided board is often disrupted by signal crossover.

### POWER SUPPLY DECOUPLING

To ensure high efficiency, low total harmonic distortion (THD), and high PSRR, proper power supply decoupling is necessary. Noise transients on the power supply lines are short-duration voltage spikes. These spikes can contain frequency components that extend into the hundreds of megahertz.

The power supply input must be decoupled with a good quality, low ESL, low ESR capacitor, with a minimum value of 4.7  $\mu\text{F}$ . This capacitor bypasses low frequency noises to the ground plane. For high frequency transient noises, use a 0.1  $\mu\text{F}$  capacitor as close as possible to the PVDD and VDD pins of the device. Placing the decoupling capacitors as close as possible to the [SSM2537](#) helps to maintain efficient performance.

## OUTLINE DIMENSIONS
