

Ideal Diode and High Side Switch NMOS Controller

NCV68261

WDFNW6
CASE 511DW

The NCV68261 is a Reverse Polarity Protection and Ideal Diode NMOS Controller with optional High Side Switch function, intended as a lower loss and lower forward voltage replacement for power rectifier diodes and mechanical power switches. The controller operates in conjunction with one or two N-channel MOSFETs and sets the ON/OFF state of the transistors based on the state of the Enable pin and the Input-to-Drain differential voltage polarity.

Depending on the Drain pin connection, both Ideal Diode and High Side Switch applications can operate in two different modes. With the Drain pin connected to the load, the applications are in Ideal Diode mode, whereas with the Drain pin connected to ground, the applications are merely in Reverse Polarity Protection mode.

Features

- Operating Voltage Range: up to 32 V
- Immune to 60 V Load Dump Pulse
- Immune to -40 V Negative Transient
- Overvoltage Protection
 - ◆ Disconnects the load from battery at $V_{IN} = 35.6\text{ V typ}$
- Enable Function (3.3 V Logic Compatible Thresholds)
- Ideal Diode Function
 - ◆ Protecting against Reverse Current Flow (from Output to Input)
- Reverse Polarity Protection (RPP) Function
 - ◆ Protecting against Negative Supply
- High Side Switch with Ideal Diode
- High Side Switch with Reverse Polarity Protection
- NCV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Grade 1 Qualified and PPAP Capable
- These Devices are Pb-Free and are RoHS Compliant

Table 1. PIN FUNCTION DESCRIPTION

Pin No. WDFNW6	Pin Name	Description
6	IN	Supply voltage input, Anode of the diode and Non-inverting input of the internal comparator. Bypass directly to GND with a ceramic capacitor. Connect to the Drain of the High Side Switch NMOS or to the Source pin (see the application schematics).
5	GND	Ground potential.
4	EN	Enable Input. High Level enables the chip. Connect to IN if enable function is not required.
3	D	Cathode of the diode and Inverting input of the internal comparator. Bypass directly to GND with a ceramic capacitor. Connect to the Drain of the Diode NMOS or to the GND (see the application schematics).
2	G	Charge pump output with discharge function. Connect to the Gate of the external NMOS (see application schematics).
1	S	Reference for the Charge pump output. Connect to the Source of the external NMOS (see application schematics).

Table 2. MAXIMUM RATINGS

Rating	Symbol	Min	Max	Unit
Input and Source Voltage DC (Note 1)	V_S	-18	45	V
Input, Source, Drain, Gate and Enable Voltage (Note 2) Load Dump – Suppressed	U_{s*}	-	60	V

Class	Functional Status
A	All functions of a device perform as designed during and after exposure to disturbance.
B	All functions of a device perform as designed during exposure. However, one or more of them can go beyond specified tolerance. All functions return automatically to within normal limits after exposure is removed. Memory functions shall remain class A.
C	One or more functions of a device do not perform as designed during exposure but return automatically to normal operation after exposure is removed.
D	One or more functions of a device do not perform as designed during exposure and do not return to normal operation until exposure is removed and the device is reset by simple "operator/use" action.
E	One or more functions of a device do not perform as designed during and after exposure and cannot be returned to proper operation without replacing the device.

APPLICATION INFORMATION

INTEGRATED CIRCUIT AND BLOCK DIAGRAM DESCRIPTION

Integrated Circuit Description

The NCV68261 can operate in conjunction with one or two external NMOS transistors. Two basic applications can be configured: an Ideal diode application or a Reverse Polarity Protection application defined by the Drain pin connection as shown in the Table 9. The applications with single NMOS are always forward conductive. The applications with two NMOS transistors provide a High Side Switch function to control the power supplied to the application.

Enable

The Enable block turns the controller ON and OFF. If the Enable function is not needed, then the Enable pin can be connected to the Input pin for permanent operation.

References

The References block provides voltage references and voltage supply for other internal circuitry. This block is supplied from the Input and controlled by the Enable block.

Input/Drain Comparator

This comparator compares voltage levels at the Input and Drain pins. Based on the Drain pin connection, the applications can be designed with both Reverse Current Protection and Reverse Polarity Protection features active (Figures 22 and 23) or with Reverse Polarity Protection only (Figures 24 and 25).

UVLO Comparator

The undervoltage lockout (UVLO) comparator compares the Input voltage level with an internal reference voltage level. When the Input voltage falls below the UVLO threshold, the output of the UVLO comparator is set to low resulting in turning OFF the charge pump and switching OFF the external NMOS transistors.

OVLO Comparator

The overvoltage lockout (OVLO) comparator compares the Input voltage level with an internal reference voltage level. When the Input voltage rises above the OVLO threshold, the output of the OVLO comparator is set to high resulting in turning OFF the charge pump and switching OFF the external NMOS transistors.

Logic

The Logic block controls the Charge Pump block according to the inputs from the Input/Drain, UVLO and OVLO comparators. The truth table of the logic function is shown in Table 10.

Pre-regulator

The pre-regulator provides a stable voltage supply for the Charge Pump block.

Oscillator and Charge Pump

The oscillator generates an approximately 2 MHz clock signal that drives the charge pump. The charge pump generates the Gate-Source voltage from the voltage provided by the pre-regulator. The OSC+CP block drives the discharge switch as well.

Table 9. AVAILABLE PROTECTION FEATURES

Drain Pin Connection	Protection Features	
	Reverse Current Protection	Reverse Polarity Protection
Load Side (Protected Battery) (see Figures 22 and 23)	Yes	Yes
GND (see Figures 24 and 25)	No	Yes

Table 10. TRUTH TABLE OF THE LOGIC BLOCK (@ EN = HIGH)

Input/Drain Comparator	UVLO Comparator	OVLO Comparator	Disch	CP_EN	NMOS
$V_{IN} < V_D$	$V_{IN} < V_{IN_UVLO}$	X	TRUE	FALSE	OFF
$V_{IN} < V_D$	$V_{IN} > V_{IN_UVLO}$	$V_{IN} < V_{IN_OVLO}$	TRUE	FALSE	OFF
$V_{IN} < V_D$	$V_{IN} > V_{IN_UVLO}$	$V_{IN} > V_{IN_OVLO}$	TRUE	FALSE	OFF
$V_{IN} > V_D$	$V_{IN} < V_{IN_UVLO}$	X	TRUE	FALSE	OFF
$V_{IN} > V_D$	$V_{IN} > V_{IN_UVLO}$	$V_{IN} < V_{IN_OVLO}$	FALSE	TRUE	ON
$V_{IN} > V_D$	$V_{IN} > V_{IN_UVLO}$	$V_{IN} > V_{IN_OVLO}$	TRUE	FALSE	OFF

Operation

The main function of the NCV68261 is to control the ON/OFF state of one or two external NMOS transistors depending on the state of the Enable pin and the difference between the voltages at the Input and Drain pins – as shown in Figures 22 to 25. Figure 5 illustrates the internal connections between the functional blocks described above.

OFF state: When the Enable input is low, the IC is in disable mode. All the internal blocks are turned OFF, and the current consumption is reduced – typically down to tens of nano-amps. In this state, the external transistors are kept OFF by an integrated 1 MΩ resistor between the Gate and Source pins.

ON state: When the Enable input is high, the IC is active. Further operation depends on the output state of the UVLO, OVLO and Input/Drain comparators. Table 10 shows the charge pump, gate discharge, and NMOS transistor states based on the output states of these comparators. The charge pump is turned ON only when the Input voltage level is between the UVLO and OVLO thresholds and above the Drain voltage level.

Undervoltage Lockout: When the Input voltage falls below the UVLO thresholds (typ. 3.25 V), the charge pump is disabled and the external NMOS transistors are turned OFF by an internal PMOS transistor. By decreasing the Input voltage further, the chip is insufficiently powered, and the external NMOSs are kept in OFF state by the integrated 1 MΩ resistor (see Figure 5).

Overvoltage Lockout: When the Input voltage rises above the OVLO thresholds (typ. 35.6 V), the charge pump is disabled and the external NMOS transistors are turned OFF by an internal PMOS transistor.

APPLICATION CONFIGURATIONS

Ideal Diode

In the Ideal Diode configuration (Figure 22), the input voltage is not allowed to discharge the output.

Conduction Mode: Prior to entering the conduction mode, the Input voltage is lower than the Drain voltage, and

the charge pump and the NMOS transistor are disabled. As the Input voltage becomes greater than the Drain voltage, forward current flows through the body diode of the NMOS transistor. Once this forward voltage drop exceeds the Input-to-Drain Gate Charge Voltage Threshold level (typ. 140 mV), the charge pump is turned ON and the NMOS transistor becomes fully conductive.

Reverse Current Blocking: When the Input voltage becomes less than the Drain voltage, a reverse current initially flows through the conductive channel of the NMOS transistor. This current creates a voltage drop across the conductive channel of the NMOS transistor which is proportional to its $R_{DS(ON)}$ resistance. When this voltage crosses below the Input-to-Drain Gate Discharge Voltage Threshold (typ. -10 mV), the charge pump is disabled and the external NMOS transistor is turned OFF by an internal PMOS transistor (see Figure 5).

Reverse Polarity Protection (RPP)

By connecting the Drain pin to the GND potential (Figure 24), the NCV68261 does not allow a falling input voltage to discharge the output below GND potential, but it does allow the output to follow any positive input voltage between the UVLO and OVLO thresholds. When the Input voltage is between the UVLO (typ. 3.4 V) and OVLO (typ. 34.8 V) thresholds, the Input/Drain, UVLO and OVLO comparators enable the charge pump to provide Gate-Source voltage to the external NMOS transistor, which is fully conductive. For Input voltage below the UVLO (typ. 3.25 V) or above the OVLO (typ. 35.6 V) thresholds, the charge pump and the NMOS transistor are disabled, and any load current flows through the body diode of the NMOS transistor.

High Side Switch (HSS)

The applications with two NMOS transistors provide High Side Switch function to control the power supply of the application. The first transistor operates as a switch, while the second operates as an Ideal Diode and/or Reverse polarity protection.

The **Ideal Diode** application in Figure 22 has rectifying properties as a common diode application, while reducing the forward voltage drop on the diode. Th application is in reverse mode as long as the Input voltage is lower than the Drain voltage.

The **Ideal Diode + High Side Switch (HSS)** application in Figure 23 combines the features of the Ideal Diode and an Ideal Switch depending on the Enable (EN) state. If the EN is high the application is in Ideal Diode mode. If the EN is

low, the application behaves as an Ideal Switch and the protected battery line is disconnected from the battery line.

The **Reverse Polarity Protection (RPP)** application in Figure 24 protects the load from negative voltages at the battery line.

The **Reverse Polarity Protection + High Side Switch** application in Figure 25 combines the features of the RPP and HSS, similarly to the Ideal Diode + HSS.

Figure 28. Application response to 11 V to -18 V transient on the Input (V_{IN}) – Reverse Polarity Protection + High Side Switch Application (see Figure 25)

C_{IN} Capacitor Considerations

For proper device performance, it is recommended that a 0.1 μF ceramic capacitor be placed as close as possible to the NCV68261 and connected with the shortest possible traces. If the device is used in High Side Switch configuration, the C_{IN} capacitor should be large enough to cover the inrush currents flowing into the application during the startup event.

C_{bulk} (Output) Capacitor Considerations

Besides presenting a sufficiently low impedance for the load input rail, in an Ideal Diode application the C_{bulk} capacitance should be high enough to maintain adequate voltage while providing load current for the duration of battery sag plus the charge from reverse current spike before the NMOS transistor turns off. Capacitor ESR is also limited by the R_{DS(ON)} of the NMOS, as high ESR can reduce reverse current flow below that needed to create sufficient NMOS reverse voltage drop (see Figure 26). The value of the C_{bulk} capacitor can be calculated according to the Equation 1:

$$C_{bulk} = \frac{t_{Disch} \cdot \frac{\Delta U_{in}}{n \cdot R_{DS(ON)}} + I_{load} \cdot t_{drop}}{\Delta U_{out}} \quad (\text{eq. 1})$$

where:

- t_{Disch}** – discharge time for the given Gate–Source capacity of the external NMOS (see Figure 10)
- ΔU_{in}** – expected battery voltage drop

Figure 29. Application Example for Optimized EMC Performance and Inrush Current Control

- n** – the number of external transistors used in the application (n = 1 for Ideal Diode or RPP applications, n = 2 for Ideal Diode +HSS or RPP +HSS)
- R_{DS(ON)}** – ON resistance of the external NMOS transistor
- t_{drop}** – the expected duration of the battery voltage drop
- ΔU_{out}** – the maximum allowed drop of the output voltage

NMOS Transistor Considerations

In general, any NMOS can be connected to the NCV68261. There are no special requirements for the transistor. From the NCV68261 perspective, the Gate to Source maximum voltage of the transistor should be rated above a 15 V level (see Table 7 with electrical characteristics) unless an external voltage protection is applied to protect the Gate–Source structure from a breakdown.

EMC and Dynamic Performance Considerations

To improve the EMC immunity to Direct Power Injection, it is recommended to use the application example and PCB layout shown in Figures 29 and 30. The recommended application contains additional capacitor connected to the Gate and GND pins respectively. The recommended component values are listed in the Table 11.

The C_G capacitance limits inrush current as well. The typical measurements are shown in Figures 31 to 33. The R_{G_Q1} and R_S mitigate potential oscillations of the output voltage during start up.

Figure 32. Startup with EN – $C_G = 1 \text{ nF}$ Inrush Current Reduction

Figure 33. Startup with EN – $C_G = 4.7 \text{ nF}$ Inrush Current Reduction

Thermal Considerations

The NCV68261 has no thermal protection function as it is not designed to handle large currents itself. Regarding the application, the most heated elements are the external NMOS transistors. In case an SMD transistors are used, maximum power dissipation, thermal resistance of the NMOSs and cooling area of the PCB should be considered to keep the junction temperature of the controller below 150°C .

PCB Layout Considerations

For optimal performance, place the transistors and the input and output capacitors as close as possible to the NCV68261. Tracks carrying high load current – Input (Battery), Source, Drain (Protected Battery) and GND are recommended to connect using power planes on the PCB. An example PCB Layout with inrush current reduction circuitry is shown in Figure 30.

onsemi, **Onsemi**, and other names, marks, and brands are registered and/or common law trademarks of Semiconductor Components Industries, LLC dba "**onsemi**" or its affiliates and/or subsidiaries in the United States and/or other countries. **onsemi** owns the rights to a number of patents, trademarks, copyrights, trade secrets, and other intellectual property. A listing of **onsemi**'s product/patent coverage may be accessed at www.onsemi.com/site/pdf/Patent-Marking.pdf. **onsemi** reserves the right to make changes at any time to any products or information herein, without notice. The information herein is provided "as-is" and **onsemi** makes no warranty, representation or guarantee regarding the accuracy of the information, product features, availability, functionality, or suitability of its products for any particular purpose, nor does **onsemi** assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. Buyer is responsible for its products and applications using **onsemi** products, including compliance with all laws, regulations and safety requirements or standards, regardless of any support or applications information provided by **onsemi**. "Typical" parameters which may be provided in **onsemi** data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. **onsemi** does not convey any license under any of its intellectual property rights nor the rights of others. **onsemi** products are not designed, intended, or authorized for use as a critical component in life support systems or any FDA Class 3 medical devices or medical devices with a same or similar classification in a foreign jurisdiction or any devices intended for implantation in the human body. Should Buyer purchase or use **onsemi** products for any such unintended or unauthorized application, Buyer shall indemnify and hold **onsemi** and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that **onsemi** was negligent regarding the design or manufacture of the part. **onsemi** is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.
